AD LECTOREM.

Motuum caelestium cognitionem vitae humanae utilem esse & summè necessariam, nemo est qui ambigat. Ut enim reliquarum in praesentia utilitatum mentio omit-
tatur, certè temporum distinctione, ac imprimis anni iusta descriptione, quæ ex motuum istorum ratione dependet & petenda est, carere societas hominum nequit. Demonstratione obtineri hoc oportere non arbitror, cum unusquisq; secum hæc reputans non possit non agnoscere, in maximis tenebris, & rerum omnium ignoratione hæsituros nos esse, anni ratione ex usu sublata. Sic etenim neq; mundi initium retro apprehendi, neq; duratio eius animo concipi, neq; tempora memorabilium ac maximè insignium rerum gestarum, in mundo, præsertim beneficiorum ingentium, quæ Deus Opt. Max. in genus humanum omnibus ætatibus contulit, sciri aut discerni possent. Præterea hæc, quæ hominum mentes in consideratione corporum caelestium defixas tenet, doctrina, perspicuum de Deo & providentia testimonium suppeditat, quasiq; viam ad cognitionem Dei aliquam sternit. Si enim animo amplissimum hoc totius mundi ^{ὅσκιμα} quis perlustraverit, nullibi manifestiora, quàm in cælo, Dei vestigia inueniet, ut non immeritò D. Paulus, gentes omnes, quæ secretæ à populo Dei patefactionibus diuinitus huic traditis caruerunt, præeunte mentis luce, τὰ ἀόρατα τῶ θεοῦ agnoscere inde potuisse affirmet. Et monumenta veterum testantur ex philosophis gentilibus eos ipsos potissimum & ex professo ἀθέτως fuisse, qui caelestium motuum inquisitionem neglexerunt, atq; repudiarunt. Non postremo itaq; loco inter Dei beneficia recensendum à nobis hoc est, quòd artes istas, quæ cæli motus inquirunt & explicant, conseruat, imò excitatis præstantibus ingenijs, illustriores & perfectiores in his postremis mundi temporibus efficit.

efficit. Nostri autem numeris erit eas diligenter cognoscere & ad
vsum in vita accommodare, id quod citra Arithmetices admini-
culum fieri non potest, ut idcirco non immerito ea, altera Astrono-
miae ala à Platone sit appellata. Quae enim solertibus artificum ob-
servationibus longo tempore animadversa & constituta, accedenti-
busq; Geometricis demonstrationibus stabilita sunt, illa assumens
Arithmetica tabulas ex his condit, motus caelestes, ad quævis tem-
porum momenta citra cæli aspersionem suppeditantes. Ut autem
duæ sunt insigniores motuum in cælo differentiae, secundum quas
ipsa etiam Astronomia in duas partes dirimitur, videlicet, Motus
primus qui ^{πυρρὸς ἐξ ἡλίου} Græcis, est καὶ πρῶτον ποσὴ, quo tota orbium
caelestium compages intra 24. horas ab ortu versus occasum integrè
reuoletur, & secundus Motus, quo stellarum fixarum & erranti-
um orbes primo motui renitentes, ab occasu in ortum feruntur: ita
duplices etiam Canones sunt, motus hosce numeris definientes &
ad temporum momenta quævis accommodantes. Alij enim primum
& simplicem extremi cæli motum explicant, ut tabulae Ascensio-
num seu Directionum vulgò appellatae, Alij verò, certis quibusdam,
quas altera Astronomiae pars tradit, hypothesis subnixi, stella-
rum fixarum & errantium motus proprios numeris comprehensos
proponunt. Et istius quidem alterius generis tabulae diuersis tem-
poribus à diuersis artificibus constructae & supputatae sunt plures.
Pro ut enim ipsa motuum ratio temporis successu deprehensa est &
constituta accuratior, ita tabulae etiam exaratae subinde sunt abso-
lutiores & perfectiores, quas tamen omnes, non tam exquisitiore
hypotheson, quibus innituntur ratione, quàm calculi certitudine &
ἀκρίβεια superant, longoq; post se intervallo relinquunt, praesentes hæc
caelestium motuum tabulae, ab ERASMO REINHOLDO præ-
stantissimo in hoc genere artifice elaboratae. Vtræq; tabulae cum
hoc tempore non sine studiosorum incommodo desiderarentur, ut
suo

suo etiam loco, & de studijs discentium bene mereretur, & publica
 cam promoueret vtilitatem, vir prudens et integerrimus SAMUEL
 SELFISCH, exhibita præterito semestri noua editione tabularum
 primi mobilis Ioannis Regiomontani, nunc hasce etiam secundo-
 rum motuum tabulas excudi denuò impensis suis voluit. Et quo
 ὁφείματα quædam, quæ in exemplaria priora typographorum in-
 curia irrepperunt, corrigerentur, quantumq̃ fieri posset emendatior
 in lucem hæc noua prodiret editio, mihi imponi laborem inspiciendi
 & emendandi typographi in excudendis hisce tabulis operas sum-
 passus: qua in re quid præstitum à nobis sit, eorum qui deinceps
 hisce vtentur canonibus iudicio permittimus, solummodò candorem
 ij vt adhibeant & benevolentiam rogantes. Gratiam igitur ha-
 bebunt studiosi huic viro, eiusq̃ voluntatem ad iuuanda liberalia
 studia propensam agnoscent: simul etiam operam dabunt, vt acces-
 sione mediocris cognitionis doctrinæ huius de motibus cælestibus,
 sine qua, Platone teste, reliqua Philosophia manca est & imperfe-
 cta, liberalem suam eruditionem auctiorem reddant. Inprimis verò
 ad vsum transferre Astronomicas hypotheses in calculo & numera-
 tione motuum, ex his & similibus tabulis, ac hoc modo extre-
 mum artis huius & finem doctrinæ de astrorum
 motibus assequi studeant.

Caspar Strubius D.

ILLVSTRISSIMO PRINCIPI
AC DOMINO, DOMINO ALBERTO MAR-

chioni Brandenburgensi, Duci Prussiae, Stetini, & Pomeraniae &c. Burggraui
Noribergensi, Domino suo clementissimo, ERASMVVS REINHOLT
Salueldensis, Mathematicum Professor.

S. D.

*Vanquam hac admiranda sapientia, quam doctrina de nume-
ris, proportionibus, figuris, mensuris, & motibus caelestibus con-
tinet, nulla humana voce satis laudari potest, tamen in alijs
libris, qui ad vsum discentium initia Mathematicum editi
sunt, prolixius de dignitate & utilitate harum artium dixi, ut iuniorum
studia utcumq. accenderentur, seu certè, ut praemuniantur iuniores
contra Cyclopicos sermones eorum, qui has artes stolidissime contem-
nunt, nec vident eas esse & sapientia diuina radios transfusos in homi-
num mentes, & illustria ac firma testimonia de Deo, & de prouidentia,
& necessaria vitae adminicula. Neesse est enim, & propter gloriam Dei,
& propter utilitates ingentes communis vitae, extare de his tantis bo-
nis, veras commonefactiones, & constantissime reprehendi furores eo-
rum, qui cum hanc doctrinam aspernantur, simul Deum contumelia
adsiciunt, & nocent communi hominum vitae. Sed quia hoc opus non edi-
tur tyronibus, hic omissa illa commemoratione, tantum gratias agam,
primum Deo auctori & conseruatori harum artium, deinde & tibi Prin-
ceps ALBERTE, qui & hanc doctrinam propagari curas, & nos-
tros labores tua liberalitate adiuuas. Itaq. ut honorem debitum Deo
tribuam, adfirmo id quod verissimum est, totam hanc sapientiam, do-
ctrinam numerorum, mensurarum ac motuum caelestium, lucem esse di-
uinitus sparsam in hominum mentes, ut ostendat hunc mundum non
casu ex Democriti Atomis conflatum esse, sed architectatricem esse,
mentem aeternam, iustam, & beneficam, & ut ingentes vitae utilitates
adferat. Adfirmo etiam Dei ope inter tantas imperiorum ruinas & bar-
baricas confusiones, non humana diligentia, sed diuinitus has artes con-
seruatas, & subinde restitutas, & illustratas esse. Hac Dei beneficia
grato pectore celebro, & eum oro, ne sinat hanc sapientiam in genere hu-
mano extingui. Eò etiam facilius hunc magnum laborem, in docendo,
& in*

4
in varijs operibus edendis sustineo, & quas tuos as artes omitto, ut De
gratitudinem in conseruatione huius sui doni ostendam. Tibi quoque
Princeps Illustrissime, Marchio ALBERTE, Dux Prussia gratias
ago, & agent alij non stolidi homines ad posteritatem, quod ut religio-
nem, leges, disciplinam, ita & has artes, quae religioni, & civili societati
seruiunt, gubernatori tuendas esse censes, & nostra studia tua liberali-
tate foves. Nec verò dubium est olim quog, sapientissimorum Regum
hanc curam fuisse, ut posteris hanc sapientiam traderent, quos ut gratia
posteritas meminisse posset, nomina eorum stellis attributa sunt. Ideo ab
Atlante, Orione, Chirone, Perseo sideribus nomina facta sunt. Nam hi
Principes viri caelestes motus obseruauerunt, anni metas constituerunt, &
ut ego existimo, insignes euentus praeuiderunt, & recens tabula Alphon-
sina dicta sunt, quod sapientissimi Regis consilio, & liberalitate hac do-
ctrina restituta est, & tabula constructa sunt, quarum iam annis plus
ducentis praecipuus usus fuerit. Eodem consilio & ego has Tabulas Prus-
tenicas dici volui, ut sciret posteritas tua liberalitate, Princeps AL-
BERTE, nos adiutos esse, & tibi gratiam ab ijs, quibus profutura sunt,
deberi.

Est autem honorificum est relinquere nominis & virtutum me-
moriā in scriptis, historijs, in trophæis, in aedificijs, tamen multo splen-
didius est & gratius, habere monumenta in his pulcherrimis, & perpe-
tuis corporibus, caelo & stellis quasi fixa, quas quoties aspiciunt homines
docti, & bene morati, excitantur, primum ut celebrent Deum conditor
rem huius mirandi operis, deinde ut gratias agant, quod monstrauit
motus, postea etiam de beneficijs magnorum Principum, & scriptorum
cogitant, quorum laboribus hac sapientia conseruata & propagata est.

Cum igitur & tuarum virtutum memoria in hac caelestium mo-
tuum doctrina posteris tradatur, spero tibi officium nostrum gratum fo-
re. Artifices verò probaturos esse & voluntatem meam, & laboris ma-
gnitudinem, & opus ipsum, confido. Sciunt enim veteres tabulas cum
phenomenis non amplius congruere, ac emendationem necessariam esse.
Laboris verò magnitudo inde indicari potest, quod nemo tot seculis ta-
bulas emendatiores edidit. Vir doctissimus quem vel Atlantem, vel
Ptolemaum alterum nominare possumus, Copernicus, etsi constitutis ob-
seruationibus demonstrationes et motuum causas eruditissime tradidit,

tamen

tamen hunc laborem tabulas construendi adeo defugit, ut si quis com-
putet ex ipsius canonibus, ne quidem ad eas observationes computatio
congruat, quibus fundamentum operis innititur. Itaque collatis Coperni-
ci observationibus cum Ptolemaeo & Hipparcho, alias tabulas institui,
quarum usum mox ostendā. Et causas earum ac fontes in alio opere expono.

Vt autem apud Poëtam de Aenea dicitur:

Nam te iam septima portat,

Omnibus errantem terris ac fluctibus aestas.

Ita ego iam annos septem huic labori impendi, non ut ille procul
terra & mari vagatus, sed tamen in his publicis miserijs, & hoc tristi
patriæ bello aliquantisper exulans cum familia, & exercitatus morbis,
luctu domestico, & rei familiaris detrimentis, quam augere potuissem,
si quæstuosas operas, aut diuinationes huic utili & erudito labori præ-
ferre voluissem. Quanta enim commoditas est, quod retrò etiam ad
mundi exordium computari motus cælestes, ex his tabulis possunt, quod
ad inueniendas Eclipses vetustas accommodatissimum est?

Plurimum autem referret in Chronologia habere rectè ordinatas
Eclipses, & magnas Planetarum coniunctiones: qua in re, si Deus qui
est fons vitæ, & sapientiæ, confirmabit huius corpusculi vires, & meos
labores reget, moliar opus, quod & multis utile, & tibi Princeps
ALBERTE iucundum fore spero.

Multa omnibus atatibus apud eas gentes, apud quas Arithme-
ticae & Geometriæ studia floruerunt, ut apud Phænices, Aegyptios,
Chaldeos, deinde & apud Græcos, Siculos, Latinos, machinæ admirabiles
Geometricæ ratione factæ sunt. Extructæ & munitæ arces, & turres,
facti pontes, naues, portus, mole, tormenta bellica. Talia opera etsi in vi-
ta necessaria sunt, tamen durabilia esse non possunt, ut in versu præcla-
rè dicitur. Mors etiam saxi, marmoribusq; venit.

Sed motuum tabula omnibus temporibus seruiunt, & perpetuæ es-
se possunt, & longè maiores utilitates vitæ adferunt, quàm vllæ pyra-
mides, turres, arces, aut Automota. Et tamen premia maiora mechanicor-
um artificum fuerunt, quàm eruditorum, qui fontes doctrinæ, & motuum
rationem generi humano ad omnem perpetuitatem conseruauerunt.

Vnus Rex Alphonsus, in hac senectâ mundi, cum has artes ferè ex-
tinctas renocaret in lucem, vidit non posse rem tantam perfici, nisi &
multi coniungerent operas, & à Republica sumptibus iuuarentur. Hunc
scribunt

scribunt in illas barbaricas interpretationes, quae tunc edita sunt (meliores enim habere non poterat) & in tabularum constructionem contulisse, quadringenta millia aureorum. Hanc liberalitatem in re tam pulchra, & utili, miramur, & magnitudinem sumptuum predicamus, cum his proximis annis compertum sit, non Reges, sed multos Principes, quorum opes non sunt pares. Alphonsino regno maiorem pecuniam effudisse in aedificationibus inutilibus. Celebrata est & Alexandri liberalitas, quod octingenta talenta Aristoteli dederit ad inquisitionem naturae animantium, videlicet Quadringenta millia, & octingenta millia coronatorum. Voluntatem horum Regum & virtutem probo, sumptus non sunt magni: quanto plus enim effudit Alexander in funus Ephestionis? Sed omitto hanc commemorationem.

Instruxit Deus gubernatores facultatibus, quarum pars aliqua conservationi Religionis, & artium debetur, idque ita ordinavit vetustas, sed propter varias vitae confusiones, honesta instituta veterum subinde mutata sunt, & mutabuntur. Interea tamen sapientes & boni Principes cum sciant pietatem Deo gratam esse, opem ferre studiis religionis & artium, non sinant prorsus deleri doctrinam vitae necessariam, cogitent ideo se in hoc fastigium diuinitus collocatos esse, ut praecipue sint custodes rerum diuinarum, vere sapientiae, iustitiae, & pacis. Has res cum & intelligunt & tuentur, imagines sunt Dei inter homines, qui haec summa bona vult intelligi, & coli, ut ipsum agnoscamus qualis sit, & ut nostrae mentes cum diuina quantum fieri potest congruant. Hec te ipsum Princeps ALBERTE saepe cogitare non dubito praesertim in hac senecta maturitate, maximeque optare & anniti, ut ad posteros transmittatur doctrina de Deo integra, & de artibus, quae & Ecclesiae & vitae necessariae sunt, quae in te ut gubernet te filius Dei, Dominus noster Iesus Christus, & te diu seruet incolumem, & tibi haeredes donet, qui & virtute patrem referant, & ornatam à te patriam feliciter gubernent, veris cum gemitibus & votis oro. Bene & feliciter valeat celsitudo tua. Anno Christi 1551, die 18 Iulij, qui dies C. Caesaris seculo insignis fuit exortu caniculae in Alexandrino Horizonte, ad cuius stelle exortum Aegyptij olim annum suum magnum accommodarunt, cum alioqui aequinoctia & solstitia certis diebus mensium nequaquam essent adfixa, sed porro vagerentur per singulos totius anni dies intra annos 1460. Iulianus.

καὶ

PRÆFATIO AVTORIS IN

Prutenicos canones cœlestium motuum.

Vltorum annorum obseruationes factæ ab eximijs artificibus testantur, ex vſitatis tabulis cœlestium motuum non posse ampliùs calculum proferri cœlo congruentem. Magnam igitur gratiam debemus summo viro Nicolao Copernico, quod & obseruationes suas multorum annorum vigilijs, & magna laboris assiduitate partas studiosis liberaliter communicauit, & collapsam penè motuum doctrinam restituit, atq; in lucem reuocauit, edito opere suo reuolutionum. Verùm vt Geometrica eius omnia tanquam summi artificis sunt perfecta, & planè elaborata, vt haud sciam an quidquam meliùs in hoc toto genere doctrinæ proferri vnquam possit, ita languisse interdum optimi sensus studium in numerorum tractatione res ipsa docet, si quis accuratè consideret canones prosthaphæreseon, & conferat ipsius inter se calculum & obseruationes.

Primum igitur Copernici obseruationes cum Ptolemæi & aliorum contuli quàm accuratissimè, ac præter nudas obseruationes, & demonstrationum vestigia aliud quidem nihil sumpsi à Copernico, sed canonis tum æqualium motuum, tum prosthaphæreseon, tum reliquos deniq; omnes de nouo condidi, in quorum etiam nonnullis aliam prorsus rationem secutus sum, quàm iudicauisse maximè conuenientem. Causas verò & rationem singularem compositionum exposui in commentarijs nostris, quos scripsi in opus reuolutionum Copernici. Habet hæc nostra ætas multos eximios artifices ac doctores Mathematicum, quibus me longè inferiores esse scio. Hos sæpè optauì publicorum studiorum gratia suscipere hunc vtilissimum laborem condendi canones. Sed cum intelligerem præcipuos harum artium Professores incumbere in alias materias suo quodam consilio, ac negligi interea potissimam partem horum studiorum, quotidie autem vrgerent me multi docti viri, subij ante sex annos hunc laborem, cuius magnitudinem etiam animo utcunq; præmetiebar, tamen nunc ausim affirmare longè maiorem esse cuiusquam opinione. Et quod potuerim hunc im-

mensum

mensum laborem tam diu sustinere, atq; institutum opus ad exitum tandem perducere, agnosco solius Dei beneficium esse, qui vires tum ingenij, tum corporis ad eam rem benignè nobis suppeditauit. Pro quo beneficio mecum alij, quibus labor noster profuturus est, ipsi Deo fonti sapientiæ ac vitæ grati esse debent.

Fortassis autem eximij artifices collatis inter se obseruationibus aliquid in motibus æqualibus deinceps limare poterunt, sed prosthaphæreseon tabulas iudico & retrò & porrò ad totam mundi durationem vtiliter seruituras.

Ex his tabulis anni magnitudo adparens quouis tempore, & maxima ☉. obliquitas supputari potest. Id hæcenus desideratum est.

Eclipses luminum hinc certius prædici possunt, quàm ex prioribus tabulis.

Etiam retrò supputari possunt tum motus omnium planetarum, tum verò Eclipses, ita vt calculus consentiat cum historia obseruationum, præsertim ea, quæ apud Ptolemaum extat, à qua Alphonsinus calculus interdum satis procul recedit.

Et in parallaxibus adieci prioribus septem Climatibus alia item 7. loca versus Boream, atq; omnem supputationem accommodaui ad mediam ☉. obliquitatem, quò rectius seruiant Canones parallaxeon omnibus ætatibus.

Postremò has nostras tabulas spero aditum facturas plurimis ad fontes ipsos apud Ptolemaum, & Copernicum penitus intelligendos, & accendentur nostro labore aliorum studia, vt

cogitent porrò etiam de conseruatione huius

artis, & emendatione motuum, præ-

sertim æqualium, vt dixi.

ORDO PRÆCEPTORVM.

ANNO M. D. LXXXV.

P R A E F A T I O.

Astrologia.

Etus nomen est Astrologia, qua intelligebant olim doctrinam non solum de viribus seu effectibus, verum etiam de motibus syderum ac corporum coelestium. Posterior autem aetas eam doctrinam, quae rationem motus

Astronomia.

stellarum contemplatur ac numeris persequitur, Astronomiam consuevit dicere, & Astrologiae nomen accommodauit ad solas praedictiones de euentibus, qui astrorum motibus & positu efficiuntur, aut significantur in hac inferiori natura. Verum de hac diuinatrice parte alias dicitur. Astronomia igitur sicut alijs duabus

Organa Astronomia Geometria, & Arithmetica.

artibus tanquam organis potissimum extruitur, & absoluitur, Geometria scilicet & Arithmetica: ita eius vsus percipitur alias numerorum subsidio, alias per instrumenta qualia sunt Astrolabia, Aequatoria, Meteoroscopia. Constat enim initia huius dulcissimae & sanctissimae artis proficisci ab observationibus de coelo sumptis per Ptolomaei Regulas, seu armillas, & id genus alia instrumenta.

Doctrina triangulorum.

Hinc Geometria in constitutione artis duplex sibi munus usurpat, quia & Hypotheses congruentes apparentium anomaliarum periodis profert, & ut ars coacta in numeros queat ad communem vsu in vita omnibus seculis sine magna molestia transferri, abditam & exquisitam rationem aperit, quam doctrinam triangulorum vocamus. Per hanc enim doctrinam ex primis illis motuum observationibus rite inter se collatis & tractatis offerunt se tum equales seu medij motus, tum horum differentiae ad eosdem medios motus vel adijciendae vel demandae, vnde apparentia loca stellarum quouis tempore in coelo etiam sine intentione observationis solo numerorum praesidio quam facillime innotescunt. Itaque Geometria vtraque huius Philosophiae partem potissimum gubernat, quarum prior quidem θεωρητική motuum considerationem certis hypothesibus subijcit, posterior autem ποικιλική admiranda solertia et industria stellarum motus vel in numeros conijcit, vel ex his rursus in certa instrumenta, sed ut multi propter ignauiam vel inscitiam numerorum perperam credunt organicam illam motuum rationem expeditiorem esse ac vsu faciliorem, (iucundam enim plenamque artificij esse quis negauerit?) ita non dubium est numerorum rationem longe esse certissimam, ac Canones seu tabulas motuum coelestium omnibus Astronomicis instrumentis esse plurimum antefereudas.

θεωρητική ποικιλική pars.

Duo genera Canonum.

Sunt autem duo velut genera canonum, quibus coelestium motuum calculus explicatur. Alij enim proponunt calculum primi motus ab ortu in occasum, qui motus omnibus Sphaeris coelestibus communis

munis est, cuiusmodi sunt **Canones primi** motus Regiomontani Directionum & similes Alij vero proponunt calculum motus stellarum tum erraticarum tum fixarum, æquinoctiorum & solstiorum magnitudinis anni, Eclipsium, Coniunctionum & similiarum, cuius generis sunt hæ nostræ Prutenicæ tabulæ, quas adiuti liberalitate inclyti Ducis Borussia, magno sanè & difficili labore longi temporis condidimus, collatis inter se accurate obseruationibus priscais & recentibus, quemadmodum alibi hæc demonstrauimus. Iam ex his omnibus manifestum est, inquisitionem coelestium motuum fieri absq; numerorum doctrina atq; exercitio non posse. Cum autem Astronomicus calculus aliquantulum dissimilis sit vsitatis præceptis doctrinæ numerorum, etsi seorsum logisticen scrupulorum Astronomicorum conscripsimus, tamen operæ precium duximus, summam præceptorum illius, quantum nostro instituto satis est, breuiter hic recitare.

N V M E R A T I O .

Ac primum quidem satis constat, ob eandem causam & annum in duodecim menses, & zodiacum circulum in quo Sol, Luna, ac quinque errantes seu Planetæ vehuntur, diuidi in duodecim partes, quas latini signa, Græci à numero δωδεκαμερεια appellant. Intra anni enim spacium quo Sol Zodiacum perlustrat, Luna ad Solem duodecies reuertitur, totiesque diametrum ei locum transit. Ac quia interea, dum Luna à Sole digressa eundem rursus consequitur, triginta fere dies elabuntur, ideo coeli spacium quod Sol medio tempore emensus est, in totidem partes secari intelligitur, quas à gressu Solis diurno videntur posteriores dixisse gradus. Ex his fontibus, quos natura ipsa monstrat, oritur illa hypothesis Astronomica Zodiacum & in vniuersum circulos coelestes omnes, cum vsus postulat, cogitatione diuidi in partes 360. ac vni dodecatemorio attribui partes 30. Iam hoc ab arte non natura constitutum est, partes rursus singulas velut integra diuidi in 60. scrupula prima, vnum scrupulum primum in 60. secunda, Secundum vnum in 60. tertia, similiter tertium, quartum, quintum, in quarta, quinta, sexta, qua ratione licebit semper progredi, quoties calculi vsus requirit. Hæc scrupula vocant Græci λεπτα & εἰκοσα, πέντα, δευτερα, τριτα, τεταρτα, πεμπτα, & sic vterius, Prætulit autem reliquis numeris erudita & ingeniosa antiquitas sexagenarium ob eam causam, quia inter minores nullus alius adeo multiplici-

Circulus celestis diuisus in partes 360. seu duodecim signa.

Partes vel gradus 360. cuiusq; circuli.

Scrupula sexagesima.

Numerus sexagenarius.

Sexagena

multiplices partes habet, scilicet. semissem, trientem, quadrantem sextantem, præterea partem quintam, tum decimam tum, duodecimam, tum decimam quintam, tum vicefimam & tricesimam. Nec solum partes seu gradus circuli velut integra in minutissimas ac subtiliss. quasq; particulas sexagesimas distribuimus, perpetua diuisione sexagenaria, verum ipsa quoq; integra eodem sexagenario colligimus seu coagmentamus, vt fiant sexagenæ vel ἑξήκονταδες, vt 60 partes, id est sextans circuli, sunt vna sexagena prima. Rursum 60. sexagenæ primæ partium, id est decem integri circuli sunt vna sexagena secunda. Adhunc igitur modum etiam in accumulandis seu coaceruandis integris ascendere licebit, donec vsus postulauerit. Quemadmodum igitur naturalis numerorum series crescit in infinitum vel decrescit vnitatis vel adiectione vel abiectione, ita species numerorum huius logistice perpetuo seruant eandem speciem analogiæ, nempe sexagecuplam, vt vna sexagena prima est sexagecupla partis, vna pars sexagecupla est vnus scrupuli primi, vnum scrupulum primum sexagecuplum est vnus secundus scrupuli, & sic porro descendendo, vel econtra, sicut vnum scrupulum secundum sexagesimum est vnus primi, ita vnum primum sexagesimum est vnus partis, & vna pars sexagesima vnus sexagenæ, & sic porro ascendendo donec libuerit.

SYSTEMA
specierum huius logistice.

Analogia
sexagecuplae
rationis

Utilitas huius logistice.

Quantum autem sit compendij & facilitatis in calculo, vbi vel natura vel arte talis specierum analogia constituta est, non ignotum est erudite versantibus in ea logistice, quam docti *ἡματισμὸν* vocant, & postea adparebit in multiplicationibus ac diuisionibus huius logistice. Qua in re illud etiam considerandum est, quam breuiter subtilissimæ minutissimæq; particulae totius enuncientur, vt vnum scrupulum primum est vna sexagesima particula partis vnus tanquam integri, scrupulum vero secundum est vna tricesima sexta particulae centesimæ partis vnus seu gradus tanquam integri. Scrupulum autem tertium, est vna ducentesima sedecima particulae millesimæ partis similiter vnus. In hunc modum iuxta continuam progressionem seu analogiam diuisionis sexagenariæ iudicandum est de reliquis scrupulis posterioribus vel succedentibus. Similiter in partib. ipsis seu gradibus eadem analogia multiplicationis seu coagmentationis sexagenariæ compendium efficit. Nam sicut vna sexagena prima constat 60. partibus, ita vna sexagena secunda 3600. partibus & vna tertia sexa-

3

sexagena partibus 216000. & superiores vel antecedentes sexagenæ
similiter.

Porro non tantum in circulo hoc systema scrupulorum &
sexagenarum artificis cogitatio instituit, verum etiam in alijs
omnibus rebus, circa quarum considerationem Astronomia
versatur. Sic ordinamus dierum scrupula, prima, secunda, ter-
tia, aut eorundem dierum sexagenas primas, secundas, tertias.
Quam rationem sequuntur Alphonsini, & aliqua ex parte Co-
pernicus in collectionibus æqualium motuum, vt suo loco di-
cemus. Sic annorum præsertim Aegyptiacorum, qui inter ciui-
les annos soli æquales inueniuntur, ordinamus sexagenas ex
Copernici instituto. Ad eundem modum tum horas diuidimus
in scrupula prima & secunda, tum alia omnia quæ astronomico
calculo subiecta sunt.

Iam vt in summam quandam conferamus, quæ hætenus
dicta sunt, sciendum est quod tota vis numerationis in hac logisti-
ce consistat in iusta collocatione seu ordinatione specierum, vt ve-
lüt medium locum occupat, vel gradus circuli, vel id cui inte-
gri vim artificis cogitatio assignat. Hunc medium locum ver-
sus dextram antecedunt sexagenæ collectæ ex integris, scilicet
integra proxime antecedunt sexagenæ primæ, has rursus pro
xime antecedunt secundæ, & sic deinceps. Similiter medium lo-
cum versus sinistram proxime sequuntur scrupula prima, hæc
immediate sequuntur secunda, inde tertia, quarta, & cætera suo
ordine, quemadmodum hic adparet.

SEXAGENAE					SCRUPULA SEXAGESIMA				
tertiæ	secundæ	primæ	INTEGRA	primæ	secunda	tertia	quarta	quinta	&c.
3 ^a	2 ^a	1 ^a	0.	1 ^a	2 ^a	3 ^a	4 ^a	5 ^a	
Dextra pars.			Medium.	Sinistra pars.					

Cæterum in his scrupulis sexagesimis quidam decima scrupula extrema statuunt, quasi vltra progredi non liceat. Verum
vt raro ad decima vsq; descendit calculus, ita aliquando vtiliter
potest decima transcendere. Ideoq; calculus periti supputatoris
ipse finem sibi præscribet, sicut in magnis multiplicationibus,
diuisionibus, & radicum extractionibus adparet, præsertim ijs,
quæ apud Ptolomæum in *μεγάλῃ συντάξει*, aut in opere de Reuo-
lutionibus

lutionibus orbium coelestium apud Copernicum occurrunt. Canones autem æqualium motuum Ptolomæi ad sexta vsq; perueniunt tamen in annotationibus verorum motuum diarijs arduum sit calculum à gradibus & primis scrupulis non aberrare. At in medijs seu æqualibus motibus diurnis summa est adhibenda præcisio, quia vel exiguum erratum medijs motus temporis diurnitate non paruam artis ruinam trahit, Vt neglectio vnius quarti scrupuli in diurno motu videtur nullius momenti esse, & tamen annis fere sexcentis in vnum primum scrupulum euadit. Student autem veri artifices mediocriorum motuum canones ita constituere, vt si fieri posset ab uno principio ad multas annorum myriades recte ac sine vitio vlllo accommodari & adhiberi possent.

Παρακέρ
compendium.
Postremo hoc non dissimulandum est, quod antiquitas vsa sit & παρακέρ compendio in his scrupulis designandis. Non enim integras adpellationes specierum ascribebant numeris, sed ex apicum multitudine, quos numeris ipsis superscribebant, species eorum intelligebant. Vt, 0, 59, 8, 11, 22, 16, 11. 15. significant 0, partem, 59, scrupula prima, 8, secunda, 11, tertia, 22, quarta, 16, quinta, 11, sexta, 15, septima. Quod elegans compendium nobis quoque non erit aspernandum.

πρόσθεσις.

ADDITIO.

Additionis & subtractionis ratio in hac logistica vel ex vulgaribus præceptis numerorum aut etiam communi sensu penè iudicari potest. Quis enim hæc ignorat primum ritè describendos esse numeros, ut similes species collocentur sub similibus scilicet, sexagenæ sub sexagenis, gradus sub gradibus, scrupula prima sub primis, & sic deinceps? Deinde quod à dextra velut à tenuissimis particulis inchoanda sit additio, in qua si sub aliqua specie colligitur numerus maior sexagenario, abiecto eodem quoties id fieri potest, tot unitates numeris antecedentis vel superioris speciei addantur. Vbi tamen obseruabis, num in aliqua specie numerus minor sexagenario unitatem in antecedenti specie versus sinistram constituat, quod interdum fit circa medium locum, in quem reponimus speciem eam ad quam velut integrum omnes aliæ species tum superiores vel antecedentes, tum posteriores vel sequentes referuntur, Vt 30. partes seu gra-

4
 seu gradus Zodiaci conficiunt vnum $\delta\omega\delta\epsilon\kappa\alpha\tau\eta\mu\beta\epsilon\iota\omicron\upsilon$ vel signum
 & 24. horæ vnum diem, & si qua sunt his similia. Tametsi hanc
 coagmentationis dissimilitudinem seu analogiæ turbationem per
 se non admittunt nec multiplicatio, nec diuisio, nec radicem ex-
 tractio, Vt suo loco patebit. Habet autem vsum hæc logistica pars
 præcipue in colligendis seu constituendis $\epsilon\pi\omicron\chi\alpha\iota\varsigma$ æqualium seu *Vsus additio-*
 mediorum motuum ad sequentia tempora constitutam aliquam *nis.*
 $\epsilon\pi\omicron\chi\lambda\upsilon$, item in multiplicatione, denique in condendis seu propa-
 gandis canonibus æqualium motuum.

$\pi\epsilon\pi\alpha\delta\epsilon\gamma\mu\alpha$ constituendi epochen æqualis motus \odot . simplicis *Supputatio*
 ad annum Domini 1490. diem 7. Maij horis duabus ante me- *medij seu*
 ridiæ, quod est tempus natale Illustrissimi Principis ac Domini *æqualis mo-*
 Dn. Alberti Marchionis Brandenburgensis Ducis Borussiae etc. *tus.*

	Sex gra.	I	II	III	IIII
Est autem epocha seu radix annorum CHRISTI	4	32	29	51	32 55
Inde æqualis motus annorum 1400	5	50	45	11	
Et annorum 80	5	59	28	18	
Et annorum deniq; 9 plenorum	5	59	41	39	
Et ab initio 90. anni ad finem Aprilis	1	58	16	23

									&c.

*Vario domi.
uaria vel
examen*

Ac quia Canones mediorum motuum oportet esse quam
emendatissimos, proderit etiam hanc *δοκιμασιαν* seu collationem
instituire, quam ex hoc exemplo facile transferet peritus lector ad
alia. Si addis motum diurnum ad motum quinq; dierum non du-
bium est, quin emergat motus 6. dierum, qui tum ex duplo mo-
tus tridui, tum ex coagmentatione motus bidui & quatruidi existe-
re debet, quemadmodum notum est.

Similiter propagabis æqualem motum in alijs temporum
speciebus, vt annis, mensibus, horis, nisi quod in annis Iulianis
rationem bisexti habere oportet, deinde & menses sunt inæquales,
quia constant aut 28. aut 29. aut 30. aut 31. diebus, quod accurate
in hoc negocio obseruari conuenit.

ἀφαίρεσις.

SVBTRACTIO.

Vt dictum est in præcedente parte, prima cura debet esse iustæ
collocationis, & conuenientius superiori loco scribuntur numeri,
vnde debet fieri subtractio, inferiori autem loco ij numeri,
qui ab alijs auferendi sunt. Inde similia auferantur à similibus
facto initio à tenuissimis seu minimis scrupulis, vt à dextris versus
sinistram regrediaris, sicut in additione. Quod si acciderit,
vt in aliqua specie inferior numerus à superiori subduci non que-
at, memineris quod sicut in additione redundante sexagenario
sub

sub aliqua specie vnitas transferebatur ad antecedentem speciem, ita hic vnitas à vicina specie antecedente mutuanda sit, ac resoluenda, vnde sarcias inopiam superioris numeri, à quo subtrahendum est. Hæc *Major numerus quomodo subtrahendus à minori.* præcepta nihil nec noui habent, nec difficultatis. Etsi autem absurdum videtur maiorem numerum à minore subtrahere, tamen in Astronomicis calculationibus id subinde occurrit, cui inopiæ ita subueniendum est, vt ei numero, vnde subtrahendum est, adiungas integrum circulum, & postea expedias subtractionem. Sicut enim in additione integros circulos omnes abijcere solemus, ob eam causam, quam supra cōmemorauimus: ita vicissim in subtractione, quoties maiorem numerum auferre oportet ex minori, eidem minori integer ac quasi reiectus circulus, quem stella proximè perambulauit, adiungendus est, vt ex eo tanquam priori, alter numerus tanquam posterior pars subduci queat. Habet autem hæc pars logistica vsū in uenandis differentijs numerorum tum aliorum, tum eorum qui in Canonibus Prosthaphæreseon collocantur, ex quibus sanè differentijs τὸ ἐπὶ Βάλλου siue pars proportionalis elicitur, vt aliquanto post dicendum erit. Item in diuisionibus, & radicum extractionibus vsū habet. Item quoties ἐπὶ τοῦ αἰῶνος æqualium motuum aliam quæ constitutam in tabulis seu nostram aliquam antecedit, firmare seu fundare libuerit. Cuius rei & aliarum præceptionum exemplum sanè hoc sumatur Epochæ æqualis motus ☉ simplicis ad initium annorum CHRISTI saluatoris nostri est 4. sex 32. par. *Epocha retroconstituenda* 29 1^a, 51 2^a, 32 3^a, 55 4^a, Libet autem retro constituere aliam epochen, quæ hanc plenis annis bis mille antegreditur. Ex canone igitur æqualis motus ☉ simplicis respondent duobus millibus annorum 5. sexagenæ 46. part. 47. 1^a, 23 2^a, 54 3^a, 42 4^a, quæ ab epocha annorum Christi deducenda sunt, adiecto prius circulo, id est 6. sexagenis partium, sicut monuimus. Eritq; Epochæ noua duobus millibus annorum primordium annorum Christi antecedens 4. sex. 45. part. 42 1^a, 27 2^a, 38 3^a, 13 4^a.

Definitio

multiplicati-
onis.

Regula uni-
versalis.

II. De specie
emergenti ex
duarum mul-
tiplicatione.

(Faint background text from the reverse side of the page)

Prima Re-
gula.

Aut igitur inuicem multiplicantur species, quæ sunt eiusdem generis, ut sexagenæ in sexagenas, ut scrupula in scrupula. Aut species differentium generum ut sexagenæ in scrupula, vel scrupula in sexagenas. Si multiplicantur inuicem species eiusdem generis, notæ vel numeri earum inuicem additi monstrant speciem emergentem ex ipsarum multiplicatione, quæ quidem semper manet in eodem genere, ut si multiplices primas sexagenas in secundas, existunt tertiæ sexagenæ, eo quod ex notis vel numeris earum specierum, scilicet 1, 2. aggregatur ternarius notæ tertiarum sexagenarum. Similiter quoque de scrupulis iudicabis.

iudicabis. Sed si diuersi generis species inter se multiplicantur, aufer notarum numerum minorem à maiori, & reliquus numerus iudicabit tum genus tum speciem, quæ ex illarum multiplicatione existit, ut si multiplices tertia scrupula in primas sexagenas, ablata vnitas ex ternario relinquit binarium. Ideo pronuntiabis ex multiplicatione hac enasci secunda, & quidem scrupula, non sexagenas eo quod scrupulorum nota maior erat, quam sexagenarum.

Secunda.

Iam ex his apparet veritas prioris regulæ, quod mutua duarum specierum multiplicatio gignat aliam speciem, quæ tot interuallis abest à multiplicanda, quot interuallis multiplicans ab integro. Repetatur enim proximum exemplum, in quo terijs scrupulis multiplicatis in primas sexagenas fieri diximus scrupula secunda. Sicut enim 3^a scrupula tribus absunt interuallis ab integro, ita & totidem interuallis à primis sexagenis absunt secunda scrupula. Vel sicut inter integrum & primas sexagenas vnum tantum interest interuallum, ita quoque inter secunda scrupula & tercia.

Integrum autem quamcunque speciem multiplicet, gignit per se quidem eandem, sed fieri potest, ut altera quoque species accedat, nempe superior vel anterior, ut paulo post dicendum erit.

*De duabus
sequentibus
tabellis.*

Etiā autem studioso lectori arbitramur hæc satis facere, ramen quia alia alijs sunt grata vel apta, non piget etiam duas tabellas adijcere, quæ emergentem speciem oculis ipsis subiiciunt, quarum altera triangularis est, altera quadrata. Prioris tabellæ vsus erit, cum species eiusdem generis inuicem multiplicantur, siue scrupula in scrupula siue sexagenæ in sexagenas. Quæres autem species inter se multiplicandas in extremo gnomone, qui superiori vel transuerso latere & descendenti aream tabellæ intra se admittit ita ut semper maiorem speciem accipias in transuerso latere, minorem in descendente. Angulus enim communis seu proleis angularis, ut quidam loquitur, indicabit speciem nascentem ex multiplicatione, ut si multiplices quinta in tertia, in proleide angulari obijciuntur, quæ inde nascuntur, Nascuntur autem scrupula ex scrupulis, sexagenæ ex sexagenis ut prius dictum est.

At posterioris ac quadratæ tabellæ vsus est cum inuicem diuersorum generum species multiplicantur. Similis autem gnomon quadratæ aream intra se admittit, in cuius quidem gnomonis latere transuerso vel superiori species scrupulorum ordine collocantur vsque ad decima in descendenti autem latere sexagenarum species.

Cum igitur diuersæ species multiplicantur, scrupula in hac tabella sursum quære, sexagenas deorsum, rursus enim in proleide angulari obijcietur species, quæ emergit, scrupulorum quidem si fuerit supra

B z lineam

lineam diagoniam, sexagenarum autem, si fuerit infra eandem. Nam diagonia illa linea in omnibus cellulis habet gradus vel integra. Hactenus igitur dictum nobis sit de emergenti specie.

¶ Huius tabulae vsus est cum species eiusdem generis inuicem multiplicantur.

SEXAGENAE,

Fit

Fit autem plerunq; vt ex multiplicatione duarum specierum, non vna tantum enascatur species, sed alia rursus dua, quarum inferior proprie quadrat ad regulas & tabellas, quas modo proposuimus, altera vero superioris loci est, ac sexagenaria coagmentatione existit. *III. de cano-
ne.* Et si *Occasio cano-
nis.* enim maximus numerus sub qualibet minor esse debet sexagenario,

tamen pleriq; etiam numeri infra sexagenarium, dum inuicem multiplicantur, procreant numerum maiorem sexagenario, ut si 15 gradus multiplies in 21. scrupula prima, existunt quidem iuxta superiores regulas scrupula prima sed numero 315. quæ coagmentata per sexagenarium efficiunt gradus 5, scrupula prima 15. Itaq; in hac Astronomica multiplicatione plerunq; opus erat etiam sexagenariam diuisionem adhibere. Hic geminus labor vna in re, cum non iniuria molestus ac laboriosus videretur, ab ingeniosis hominibus vtiliter excogitatus est canon sexagenarum, & scrupulorum sexagesimorum, quem seorsim tibi exhibemus, velut tabulam manualement, vt vno aspectu omnia sint obuia, quæ in hac $\pi\sigma\alpha\gamma\mu\alpha\tau\epsilon\lambda\alpha$ seu tractatione desiderari possunt. Hic canon à quantis nos molestijs liberet in multiplicationibus, diuisionibus, & radicum extractionibus Astronomicis, apparebit postea. Est autem forma eius non omnino quadrata, sed oblongior, & componitur ex duabus areis. priori quidem trapezia, quæ locum inferiorem tenet, posteriore autem simul & superiori triangula. Quare duplicem lineam diagoniam efficit, in cuius cellulis seu domicilijs quadrati numeri collocantur, vt postea patebit. In extremo autem limite trapezij ad sinistram descendendo sunt numeri positi iuxta naturalem seriem, ab vnitae vsq; ad 60. sed in diagonia linea ab vnitae tantum ad 30. perinde vt & in transversa linea inferiori, denique à 10. vsq; ad 60. in extremo limite ad dextram eiusdem trapezij. Similiter in trianguli transversa linea, scilicet superiori, ponuntur numeri à 60. vsque ad 5 retrogradè, ac iidem numeri similiter descendendo in eiusdem trianguli dextro limite. Hæc etsi ex aspectu canonis per se sunt nota, tamen quia hi extremi numeri sunt indices illius inuestigationis, de qua deinceps dicemus, non piguit monere.

Iam de vsu canonis sit hæc prima regula. Quando alter numerorum inuicem multiplicandorum minor fuerit trigenario, vtendum est trapezio: sed si uterq; maior, vtendum est triangulo. Altera, semper maiorum erus quærendus est in limite vel latere, siue dextro siue sinistro. Minor autem in linea diagonia vel transversali, siue superiori siue inferiori. Tertia, in angulo communi seu profelide angulari, inuenies id quod nascitur ex vtriusq; dati numeri mutua multiplicatione & quia semper bini numeri offeruntur in angulari cellula, dexter quidem

*Descriptio
canonis.*

*De vsu canonis
regula.*

1

quidem siue sequens propriè est illius speciei, de qua regulas tradidimus
 sinister autem vel autecedens ad speciem vno loco superiorem pertinet.
 Vt sint rursus multiplicandi 15, gradus in 21. scrupula prima, accipe 15.
 in linea diagonia trapezij, & 21. in latere sinistro. Inuenies igitur in an-
 gulari profelide 5. 15. id est, 15. scrupula prima, cum 5. gradibus. Nec
 opus esse arbitror vti pluribus exemplis in re planissima, cum & in se-
 quentibus idem subinde reperemus.

**III. Præ-
 pta multipli-
 cationis.**

Restat, vt his ita præparatis præcepta nunc multiplicationis sub-
 iungamus. Datis ergo duobus numeris inuicem multiplicandis, com-
 modius maiorem collocaueris supernè, & minorem inferè. Maiorem
 autem numerum voco eum, qui in plures species distributus est. Sic
 autem colloca vt vltima species inferioris seu minoris numeri recta
 consistat sub vltima specie superioris vel maioris numeri, nec modo
 refert, utrum diuersæ, vel eadem species in eundem locum coueniant.
 Postea subius inferiorem numerum ducto lineam siue simplicem malu-
 eris siue duplicem. Deinceps iuxta doctrinam de usu canonis proximè
 traditam multiplicato vltimæ seu minimæ inferioris speciei numerum
 ordine in singularum specierum superiorum numeros à dextra versus
 læuam progressus, ac ordine promouens versus sinistram scribe nume-
 ros, qui ex multiplicatione nascuntur, siue singuli sint, siue bini, quod
 plerumque fit. Hinc subducta linea discriminis causa multiplicato
 iam similiter penultimæ speciei inferioris (si qua adest) numerum in
 omnes superiores suo ordine & initium scriptionis natorum numero-
 rum facies sub ipsis penultimis speciebus, supra primam lineam positis.
 In hunc modum petge, donec omnes inferiores numeros in singulos
 superiores duxeris, sicut etiam in vulgari logistica de multiplicatione
 præcipitur. Fortasse autem proderit duxisse lineas perpendiculares, vt
 singulæ species citra erroris suspensionem rectè discernantur, Quod cu-
 iusq; industriæ relinquitur. Ad extremū igitur singulorum locorum vel
 specierum numeros conijce in vnam summam, reiectis subinde 60, &
 pro eis vnitate antecedentibus addita, vt in additione docuimus.

**Exemplum
 primum.**

Sed vnum atq; alterum exemplum adjiciamus huic longo præcepto
 ex quibus cætera omnia similiter æstimabit prudens lector. Diurnus mo-
 tus solis compositus, scilicet, a medio æquinoctio est scrupulorum 59^a,
 82^a, 193^a, 374^a, 245^a, 256^a, 417^a, 398^a. Cupio scire motum 30.
 dierum. Id ita cognosces, si 30. multiplicaues in omnes numeros
 diurni motus ☉. vt primum 30. multiplicata in 39. faciunt 19. 30.
 scribe 30. sub 39, & 19. loco priori. Inde in 41. ducta 30. faciunt 20.
 30 scribe 30. sub 19. & 20. loco rursus priori. Ad hunc modum
 vsque ad vltimum numerum iuxta sinistram pergentes, & adden-
 tes

Abijcitur autem primum sicut supra diximus sexagena secunda vna, tanquam decies sex sexagenæ, id est, decem integri circuli, Deinde etiam ex 14. sexagenis primis abijciuntur 12. sexagenæ tanquam duo circuli. Relinquitur ergo annuus motus D. æqualis à O. 2. sexagenæ primæ 9. partes 37 1^a, 22 2^a, & reliqua scrupula suo ordine, quemadmodum infra etiam Canones nostri habent.

Postremo si quis δοκιμασίαν siue examen operis sui desiderat in hac parte logistices, is vel iterato calculum instituat, vel sequentem partem consulat. Nam in hoc examine mutuas operas tradunt, multiplicatio & diuisio, perinde vt additio & subtractio.

μερισμός ἢ παραβολή.

D I V I S I O.

Definitio.

Diuisio est cum datis duobus numeris inæqualibus tertius quidam inuenitur, qui vel toties continet vnitatem, quoties maior minorem, uel toties ab vnitatem continetur, velut integro, quoties minor à maiori. Alter autem datorum numerorum vocatur diuidendus, alter diuisor, nec refert vter ex his maior sit, vel minor, Tertium vero qui ex his colligitur, alij quorum numerum, alij diuisorium, alij partitionis numerum appellant. Quando igitur diuidendus numerus maior est diuisore, manifestum est, quod & diuisorius vel quotus maior est vnitatem, sed cum minor est diuisore, quotus numerus euadit infra vnitatem, in aliquam speciem scrupulorum. Deinde sicut in multiplicatione, ita & in Diuisione quatuor existunt numeri proportionales, nempe vt diuidendus ad diuisorem, sic quotus numerus ad vnitatem velut integrum. Ex quibus hæc regula sumitur, quæ gubernatrix est omnium sequentium præceptionum de emergenti specie, quod in vniuersum partitionis numerus tantum distet ab integro, quantum à diuisore distat diuidendus.

Regula vniuersalis.

παραβολή.

Cæterum qui græca lingua logistices præcepta tradiderunt vocant diuisionem etiam παραβολήν appellationem mutuati à Geometris, qui cum iubent ad datam aliquam rectam lineam accommodare arcam datæ areæ æqualem, viuuntur verbo παραβόλην. Quomodo autem hoc Geometricum problema congruat diuisioni numerorum alibi copiosè explicauimus.

De specie emergenti.

Deinceps autem dicemus, quæ species existat alia diuisa in quamlibet aliam, in quo præcepto nonnulli ante nos à scopo plurimum aberrarunt. Sit igitur rursus in conspectu Canonion illud, quod in eundem vsum in multiplicatione à nobis proponebatur.

4^a 3^a 2^a 1^a 0 1^a 2^a 3^a 4^a 5^a 6^a 7^a
 Quartæ Tert, Secun, Pri, INTEGRA Prima, Sec, Tert Quart, Quint, Sex, Sept.
 SEXAGENAE, SCRVPULA

Nunc sit hæc prima consideratio, utrum duæ species, quarum altera in alterâ diuidenda proponitur, sint eiusdem generis nec ne, & si non fuerint inter se similes, vtrâ ab integro recedat longius. Hinc prima regula *Prima res* sit, si species fuerint similes, ac eiusdem præterea generis, quota species *gula.* per se pertinebit ad speciem integrorum siue gradus, siue dies, siue aliud quiddam fuerit loco integri, ut si prima scrupula gradus sint diuidenda in prima scrupula, si modo diuidenda scrupula non fuerint pauciora diuidentibus, quota species existit graduum. *SECUNDA.* Si species fuerint dissimiles, sub eodem tamen genere, aufer notam minoris species à nota maioris. Reliqua enim nota ostendit speciem quæ ex diuisione nascitur, quæ semper eiusdem generis cum vtrâque specie pronuntiabitur, quando diuidendæ speciei nota maior fuerit, alterius autem generis, cum nota diuidendæ speciei minor fuerit. Eius autem speciei notam maiorem dicimus, quæ ab integro abest longius, ut sexta scrupula habent maiorem notam, scilicet, senarium quàm quinta scrupula quorum nota quiniarius est, & longius absunt ab integro sexta scrupula, quàm quinta. Ut si tertia scrupula partiatur per secunda scrupula exeunt rursus scrupula, nempe prima, quia tertiorum species, ut diuidenda longius abest ab integro, quàm species, quæ diuidentis munere fungitur. Ita si sexagenæ tertiæ diuidantur in secundas, quota species erit primarum sexagenarum, ita ut non transeat quota species in aliud genus. At si secunda scrupula diuidantur per tertia scrupula, exeunt primæ sexagenæ, vel si secundæ sexagenæ per tertias exeunt prima scrupula, mutato nimirum utrobique genere. *TER TIA* regula si duæ propositæ species non fuerint eiusdem generis, notæ specierum iunctæ inuicem ostendunt notam speciei, quæ ex diuisione illa nascitur, quæ quidem semper cum genere speciei diuidendæ congruit, ut siue diuidas tertias sexagenas in secunda scrupula, siue secundas sexagenas in tertia scrupula, existunt ex hac diuisione sexagenæ quintæ, similiter siue diuidas tertia scrupula in secundas sexagenas, siue secunda scrupula in tertias sexagenas, omnino quota species existit quintorum scrupulorum.

Ex his iam prudens lector iudicare potest, quod summa harum regularum comprehensa sit in illa priori generali, nempe quod species quæ existit è diuisione, tantum recedit ab integro, quantum diuidenda abest à diuidente. Ecce autem breuem tabellam, quæ regulas omnes brevissimè ob oculos ponit.

C

Si

Si utraq; species, diuidenda & diuidens, fuerit Generis.

Eiusdem,

Aufer notam minoris
speciei à maiori. Reli-
qua enim nota vel nu-
merus ostendit speciem
emergentem generis.

Eiusdem

Alterius

Quando nota diuidendæ
speciei fuerit.

Maior

Minor.

Diuerſi,

Iunctæ notæ specierum
efficiunt notam emer-
gentis speciei, quæ sem-
per est sub eodem gene-
re cum specie diuidēda,

Cautio.

Atq; hæc præcepta de emergenti specie rectè valent, dum numerus
sub diuidenda specie non minor fuerit numero sub specie diuidente,
sed si minor fuerit, non amplius existit illa species, quam monstrant
nostræ regulæ, sed alia vno loco inferior, vt si diuidas 6. scrupula in 12.
scrupula prima, existunt 30. non gradus vt prima regala docebat, sed
scrupula prima, quæ vno loco inferiora sunt gradibus. Caterum ha-
rum præceptionum demonstrationes, si quis requirit, vel alterum scri-
ptum nostrum huius generis prolixius consulat, vel Theonem in $\mu\epsilon\gamma\alpha\lambda\omega\sigma\omega\tau\alpha\epsilon\gamma\eta$ Ptolemæi.

*Vsus canonis
 $\epsilon\epsilon\gamma\kappa\omicron\nu\tau\acute{\alpha}\delta\omega\mu$,
& ratio diui-
sionis.*

Nunc simul & vsum canonis sexagenarum & scrupulorum in di-
uisione & præcepta ipsa diuisionis trademus. Sicut autem in vulgariū
numerosum diuisionibus, ita hic quoque de numero sub quota specie
coniectura sumitur ex numero, sub maxima specie diuidente, quæ ad
sinistram extrema est, si tamen species diuidentes plures fuerint vna.
Nam si numerus sub illa extrema specie diuidente, fuerit minor nume-
ro sub extrema specie diuidenda, numerum sub quota specie potes
sine canone coniectare, quia nullus numerus huius logistica superat sex-
agenarium, sed potius ad aliam speciem transfertur, vt si diuidendi sunt
28. gradus in 7. non obscurum est numerum sub quota specie esse qua-
tuor. Sed si numerus sub vltima specie gubernante hanc coniectu-
ram fuerit maior, quàm numerus sub diuidenda, extrema species di-
uidens à loco sub extrema specie diuidenda traducenda est sub vicinam
speciem versus dextram, prorsus vt in vulgari diuisione fieri solet, ita
vt iam de numero sub quota specie non ex vna specie, sed ex duabus
contiguis coniectura fiat, quam coniecturam canonis subsidio facile
expedies in hunc modum. Numerum sub diuidente specie, quam
gubernatricem diximus, quære in aliquo limitem vel trapezij vel trian-
guli, ac in eodem ordine, vel inter easdem parallelas conuenientes
(siue perpendiculares, siue transuersales) quære numeros sub utraque
diuidenda, aut saltem proximè minores. Nam è regione cellula con-
tinentis

tenentis hos numeros alter limes, qui priori ad rectos angulos existit, numerum ostendet sub quota specie collocandum. ut sint 55. gra. 24^a, diuidenda per 59. quare igitur 59. tanquam numerum sub diuidente specie in limite dextro trianguli. Nam in ordine seu tractu eius transuersali reperies hos geminos numeros 35. 24. ac è regione alter limes transversalis seu caput canonis monstrat 36 numerum scilicet sub quota specie. Qua in re illud etiam obseruandum est, accidere interdum, ut si numeri sub reliquis speciebus diuidentibus, fuerint maiores, sumendus sit pro numero sub quota specie, non js. quem maximum vel primum offert gubernatrix species, sed alius vnitate minor, id quod res ipsa docebit planissime. Hac igitur solertia inueniuntur numeros sub quota specie, in singulos numeros sub qualibet specie diuidente multiplicandus est, & nati inde numeri conuenientibus locis superne scripti (sic enim nobis commodissimum videtur) ab inferioribus immediatis subtrahendi, ac reliqui tandem rursus suis locis superne scribendi. Quod si quis nostram rationem penitus sequi volet. solos numeros subtrahendos lineola transfiget, sic ut alteri, vnde subtrahitur relinquantur integri. Nam hæc diligentia discernendi numeros prodesse tibi potest, si quando expedito numero sub vna quota specie, idem calculus iterandus fuerit.

Quod si post subtractionem aliquid de diuidendis speciebus remanserit, ut numerus sub alia quota specie denuo querendus sit, numeri sub singulis speciebus diuidentibus ordine vno loco versus dextram promoueantur, ac instituatursimilis tum coniectura, seu exploratio, tum calculi ratio. Vbi si acciderit, numerum sub gubernatrice specie maiorem esse eo, qui directe superior est reliquis sub speciebus diuidendis, tunc cyphram seu 0 sub hac quota specie scribendum esse memineris. Hæc igitur calculi ratio toties iteranda est quoties usus postulaverit. Concinnum etiam nobis videtur, species diuidendas à diuidentibus disiungi medijs duabus parallelis lineis, intra quas numeri sub quotaspecies collocentur. Similiter quod de lineis perpendicularib. diximus in multiplicatione ad distinguendas species id vel maxime in diuisione faciendum esse censemus. Reliquum est, ut hoc satis prolixum præceptum diuisionis vno atq; altero exemplo illustremus. Ac repetatur sanè primū exemplū, quo in multiplicatione vsumus, ac sint diuidendi 29. gr. 34^a, 9^a, 2^a, 48^a, 3^a, 42^a, 12^a, 5^a, 50^a, 6^a, 49^a, 7^a, 30^a, 8^a. per motum diurnum ☉ compositū æqualem, scilicet, 59^a, 1^a, 8^a, 2^a, 19^a, 3^a, 37^a, 4^a, 24^a, 5^a, 25^a, 6^a, 41^a, 7^a, 39^a, 8^a. ut adpareat, quanto tempore sol secūdum æqualem cursum hunc Zodiaci arcum peragret. Manifestum est autē quod numerus sub extrema specie diuidente i. 59. superet numerū sub extrema diuidenda, ut 29. Alioqui cū gradus diuidimus per scrup 1.

Exempla 1.

ex diuisione existerent sexagenæ dierum primæ. Nunc dies saltem inde nascuntur, quibus iam integrorum locus debetur, ac sic collocanda sunt porro sub 34. & reliqui deinceps numeri sub reliquis suo ordine. Iam si examen vel coniecturam instituas, qualem diximus. inuenies 59. in 29. 34. contineri tricies. Nam 59. multiplicata in 30. faciunt 29. 30. quæ superne scripta suis locis & subtracta ex 29. 34. transfixaque relinquunt, 0. 4. & reliquos inde numeros sub speciebus diuidendis ad dexteram. Transfige & 59. Similiter 30. multiplicata in 8. gignunt 4, 0. quæ scripta suis locis superne, & post subtractionem transfixa relinquunt iisdem locis 0. 9. Transfige 8. Rursum multiplicata 30. in 19. gignunt 9. 30. quæ scripta, subtracta, transfixaque relinquunt iisdem locis 0. 18. Ad hunc modum si perrexeris tum multiplicando, tum subtrahendo, nihil tandem relinquetur. sed omnes numeri sub diuidendis speciebus consumuntur. Propositum igitur arcum Sol æquali motu composito conficit diebus 30. Subiecinus autem typum integri calculi, quod vel ipse aspectus calculi aliquid lucis adferat præceptis.

30								
	59	8	19	37	24	25	41	39

Repetamus & alterum exemplum multiplicationis. Pertransierit nimirum Luna 1. sexagenam secundam, 14. sexagenas primas, 9. gra. 37^a, 22^a, 27^a, 3^a, 16^a, 46^a, 51^a, 6^a, 11^a, 7^a, 55^a, 8^a. cumq; motus diurnus \gg æqualis a \odot . fit 12. gr. 11^a, 26^a, 2^a, 41^a, 3^a, 29^a, 4^a, 57^a, 5^a, 49^a, 6^a, 37^a, 7^a, 11^a, 8^a. queritur. quot diebus vel quanto tempore Luna tot partibus à sole remoueat. Colloca numeros omnes tam diuidendos, quam diuidentes, vt in præcedenti exemplo, Ac primum 12. in 1. 12. habentur sexies, quæ sunt sex sexagenæ dierum. Nam iuxta superiores regulas sexagenæ primæ graduum diuisæ in gradus velut integra pariunt sexagenas dierum, siquidem numerus sub secundis sexagenis, quippe sola vnitas, diuidi per 12. minime potest. Iam 6. vt inuentus numerus sub sexagenis primis dierum, velut sub prima quota specie dierum collocandus, si multiplicetur in singulos numeros sub speciebus

[illegible]

Arbitror etiam Studiosum lectorem hic non requirere plura exempla. Si quis in vno probe se exercuerit & naturam vsūq; præcepti recte didicerit, expediet deinceps omnia, quæ offeruntur, simili modo.

DE PARTE PROPORTIONALI.

περί τῶ ἐπιβήλλοντος.

Pars proportionalis, aut vt Græci vocant, $\pi\epsilon\iota\beta\alpha\lambda\lambda\omicron\upsilon\sigma$, est id quod alteri congruit iuxta datâ rationem, vel vt vulgo loquuntur, est inuenire ignotum velut quartum numerum in proportionē datis tribus. Cum enim dantur tres numeri ad eliciendum quartum in proportionē, ex tribus illis datis duo inter se certa ratione cohærent. & tertij numeri velut antecedentis termini in altera ratione quæ priori similis est, comes investigatur, vt si dicam, 1. gradus dat 24. scrupula prima, quot dant 20.

C 3

scrupula

Regula detri scrupula prima, quot dant 20. scrupula prima, hic quaeritur, qui numerus
barbare ut congruit ad 20. scrupula ea ratione, qua ad vnum gradum congruunt 24.
caur. scrupula prima, Vel quaeritur quartus numerus in proportionem cum 3.
prios dat fuerint. Quare quod logistae vulgo docent ignorum nume-
rum venari ex tribus, id prorsus in Astronomico calculo est quaerere
partem proportionalem seu congruentem.

Prodest autem dissimilitudinem praeceptorum in verbis aut genere
sermonis potius quam in rebus sitam considerare. Nam quod logistae
praecipunt, tribus numeris, qui dati sunt, ritè collocatis multiplicare
tertium in secundum, & natum ex ea multiplicatione partiiri in primum
ut existat quartus numerus, idem planè praecipit Astronomicus calculus
sed paululum mutatis verbis. Iubet enim posterioris rationis antecede-
ntem terminum, qui solus datur, multiplicare in terminum conse-
quentem prioris rationis, numerumq; inde ortum partiiri in terminum
antecedentem eiusdem prioris rationis. Quotus enim numerus huius
diuisionis est consequens terminus posterioris rationis qui ignorabatur,
pars scilicet proportionalis, vel $\pi\epsilon\pi\epsilon\lambda\lambda\omicron\upsilon\varsigma$, ut subinde nominat
Ptolomæus. Ut si repetatur propositum exemplum, 1. gradus dat 24.
scrupula prima, quot dant 20. scrupula prima: multiplicata 20. in 24.
exhibent ex canone sexagenario 8. 0 id est, 8 scrupula prima, 0. sec.
quia iuxta superiores regulas scrupula prima in prima gignunt secunda
scrupula cum primis. Iam si 8. 0 2^a, diuidas per 1. gradum, erunt si-
militer 8. 1^a, 0 2^a, eo quod gradus velut integrum per se non mutat vl-
lam speciem, vnitas autem non diuidit, id est, non mutat magnitudi-
nem diuidendi numeri.

Ex hoc igitur vnico exemplo satis apparet, quomodo in Astrono-
mico calculo pars proportionalis inuestigetur. Ac ut breuiter, & semel
dicam, quod res est, totum hoc negotium planissimum est, tractatioq;
facilima, si obserues regulas de speciebus nascentibus traditas supra in
multiplicatione & diuisione

Duae species
in Astronomi-
co calculo.
PRIOR.

Esti autem hæc, quæ diximus, summam continent negocij, tamen
duas insignes species, quæ in hoc Astronomico calculo occurrunt, bre-
uiter libet prius commemorare quam ad sequentia accedamus. Alias
enim gradus seu integrum tenet locum diuisoris alias verò gradus tenet
aliud locum quam primum, prior casus occurrit, quoties canonem
aliquem Prosthaphæreseon, aut similem, qui ad singulos gradus pro-
pagatus est, ingredimur lateraliter, hoc est, cum vterque numerus for-
tis sumitur. In omnibus autem huiusmodi exemplis sola multipli-
catio expedit quaestionem, nec locus est diuisioni, ut in præcedenti ex-
emplo, 1. gra. dat 24. 1^a, quot dant 20. 1^a, per solam multiplicationem
inueniuntur

inueniuntur 3 : 2, 6 : 2. quæsius scilicet numerus proportionalis in duas species scrupulorum distributus. Et hoc vulgo vocant inuenire partem proportionalem ad 60,

Posterior autem casus occurrit, quoties Canonem aliquem propa-
 gatum ad singulos gradus ingredimur arealiter, id est, cum ex duobus
 numeris, qui aliorum inuentioni seruiunt, alter foris accipitur, in latere siue
 dextro siue sinistro, siue etiam in linea transversali tam superiori quam
 inferiori, alter vero in area canonis. Hic plerumque accidit, cum qui
 in inuentione partis proportionalis fungitur munerere diuisoris, non
 esse 60. sed maiorem vel minorem sexagenario. Gradus enim qui
 in priori casu diuisoris munus tuebatur, in 60. scrupula resolui intelli-
 gitur. Omnia autem exempla huius posterioris casus sola diuisione ex-
 pediuntur, quia unus gradus nec species mutat, nec numeros sub specie-
 bus, Vt si hoc exemplum proponatur 24. scrupula prima dant vnum gra-
 dum, quantum dant 8. scrupula prima, multiplicata 8. scrupula prima per
 1. gradum manent 8. scrupula prima, quæ diuisa in 24. scrupula prima ex-
 hibent 20. scrupula prima. Scrupula enim prima diuisa pariunt gradus,
 vel scrupula prima, tunc scilicet, quando numerus sub diuidenda specie
 fuerit minor numero sub specie diuidente, vt hic 8. scrupula pauciora
 sunt, quam 20. Quare in huiusmodi exemplis recurrendum est ad præ-
 cepta diuisionis, quæ supra copiose tradita sunt.

In vtraque ergo harum specierum, quum 3. datorum numerorum,
 ex quibus quaeritur pars proportionalis, vnus fuerit talis, vt representet
 60. vt gradus vel dies, vel hora valet 60. scrupulis primis, commodè
 vteris nostris præceptis & canone sexagenarum vel scrupulorum sexage-
 simorum. Sin vnitas alium numerum representat quam 60. vt 10. vel
 12. vel quemuis alium, sequere præcepta communis vel vulgaris illius
 logistica, quod quidem deinceps suo loco, vbi opus erit, monebimus

EXTRACTIO RADICIS

Quadrata.

ἐπιλογισμὸς τῆς πλεονεξίας
 τετραγωνικῆς

Extractio

Extractio quadratæ radicis: vt vulgo vocant, est certa & expedita ratio, ex dato numero eliciei ndi alium, qui quot vnitatibus constat toties á dato numero contineatur. Vel qui in sese multiplicatus eundem datum vel omnino vel proximè restituat. Neq; enim omnis numerus talis est, vt alius quispiam eo minor in sese multiplicatus gignat eundem prorsus, quin potius in toto numerorum systemate hi admodum rari existunt, qui propter hoc ipsum axioma vel prærogatiuam peculiari nomine quadrati vocantur. Sequitur autem ex hac definitione radicem semper medio loco proportionalem esse inter vnitatem & ipsum quadratum numerum ita vt sit vnitas ad radicem, sicut radix ad numerum quadratum, vel è contra, verbi gratia, 1. ad 10, vt 10, ad 100. Nam denarius est quadrata radix de 100.

*De specie
emergenti.*

Esti autem aliqua cognatio est huius partis logistica cum Diuisione, tamen & dissimilitudo vtriusque partis insignis est. Nam in extractione radicis datur vnicus tantum numerus, instar diuidendi dissimulato diuifore, & hic ipse quasi diuifor numero quoto vel partitionis perpetuo æqualis est. Vocant Græci scriptores hanc logisticæ partem *ἐπιλογισμὸν πλεονέκτεταγωνικῆς*, quia magna diligentia ubiq; in hisce disciplinis tradendis respiciunt ad veros fontes Geometricos. Quæ autem species sexagenarum vel scrupulorum oritur, dum latus tetragonum ex propositis speciebus extrahitur, id vel ex superioribus præceptis in multiplicatione iudicari potest. Sicut enim gradus multiplicati in gradus gignunt gradus, ita è contra, cum è proposito numero sub gradibus tetragonum latus elicitur, prima occurret species graduum. Rursum sicut scrupula prima multiplicata in prima gignunt secunda, ita in exquisitione lateris tetragonici ex numero aliquo sub quartis, existeret prima species debet secundorum scrupulorum. Itaq; vniuersaliter excerpta radix pertinet ad eam speciem, cuius nota dimidium est notæ eius speciei, sub qua numerus est, ex quo tetragonum latus exquirimus.

De locis.

Iam hoc Præceptum de emergenti specie comitatur per se alterum de locis, in quibus hanc exquisitionem radicis seu tetragonici lateris institui conueniat. Cum enim nulla species in se multiplicata gignat speciem, cuius nota sit impar numerus, manifestum est hanc exquisitionem instituendam esse tantum in locis paribus, hoc est, immediate ex iis numeris, qui subsunt speciebus, quarum notæ sunt pares numeri, vt sub gradibus, scrupulis secundis, quartis, sextis, octauis, item sub sexagenis secundis, quartis, sextis, & ita porro vtrinq; ab integro tanquam medio.

Reliqua præcepta huius partis logistica omnino in his Astronomicis spe-

cis speciebus, vs in alijs vulgaribus numeris pendet ex quarta propositione secundi elementorum Euclidis. Tantum igitur hoc restat, vt exemplis doceamus, quomodo ex numeris sub Astronomicis speciebus exquiratur tetragonum latus subsidio canonis sexagenarij.

4. secundi ele.
Euclid.

Sit ergo inueniendum latus tetragonum de 15. scrupulis primis. *Exempla.*

At quia primorum scrupulorum locus impar est, adde cogitatione parem, qui proximè sequitur ad dextram, videlicet locum secundorum. Itaq; iam inuenies latus tetragonum de 15. scrupulis primis, 0. sec. hac ratione. Supra diximus ad lineam diagoniam poni quadratos numeros, quorum radices seu latera tetragonica sunt ipsi capitales numeri, vel in diagonia linea, vel in superiori transversa. Quæro igitur ad ipsam lineam diagoniam vel trapezij, vel trianguli, ubi vel 15. 0. vel proximè minores numeri collocentur. ac video eosdem prorsus subesse 30. qui est capitalis numerus lineæ diagoniæ. Pronuncio igitur radicem quadratam ex 15 1^a 0 2^a , scr. esse 30. scrupula prima, quia ex secundis Prima radix est primorum scrupulorum.

Aliud exemplum. Proponantur 1. gr. 10 1^a , 46 2^a , 41 3^a , 40 4^a , ex quibus eliciendum sit tetragonum latus. Loca igitur huius exquisitionis sunt gr. secunda & quarta. Ac primum sub gradibus venor radicem, nempe 1. gr. qui in se multiplicatus & subtractus relinquit 0. gr. Inde promoueo inuentam vnitatem prius duplicatam sub speciem scrupulorum primorum vacante loco secundorum, & inquiri aliam partem radicis ex 10 1^a , 46 2^a videlicet 5. scrupula prima. Hæc primum multiplicata in 2. gr. faciunt 10. scrupula prima, quæ suo loco scripta & subtracta, vt in diuisione, relinquunt nihil, deinde eadem 5. scrupula prima in sese multiplicata gignunt 25. secun. quæ scripta loco secundorum supernè, & ab iisdem 46 2^a , scr. subtracta relinquunt, 21. in loco secundorum scrupulorum. Cum autem 25 2^a scrupula, reliqua sint pauciora duplo radicis inuentæ, adiecta præterea vnitæ, id est, 2. scrupulis primis 11. secundis, constat quinarium esse maximum quadratum ex prioribus reliquis 10 1^a , 46 2^a , scr. Rursum iam inuentam radicem 1. gr. 5. scr. pri. duplatam promoueo vno loco versus dextram, vt vacet iam solus quatorum locus reliquus, & ex residuis 12 2^a , 41 3^a , 40 4^a exquiri nouam partem radicis, quam conijcio esse 10. quia bis 10. sunt 20, quæ de superioribus parum relinquunt. Adscribo igitur priori radici 10 2^a , scr. & rursus eandem multiplico primum in 2. gr. ac fiunt 20 2^a , scr. quæ scripta conuenienter, & ablata ex 21. relinquunt 1 2^a , scr. Inde eadem 10 2^a , scr. multiplicata in 10 1^a , scr. fiunt 1 2^a , 40 3^a , quæ ablata ex superioribus relinquunt 0 2^a , 1 3^a , scrup. Porremo eadem quoq; 10 2^a , scr. in sese multiplicata faciunt 1 3^a , 40 4^a , scr.

PRÆCEPTA CALCULI MOTVVM COELESTIVM.

PRIMUM PRÆCEPTVM DE æquando tempore ob inæqualitatem dierum naturalium

*Initium præ-
ceptorum de
motuum sup-
putatione.*

I.

DVæ sunt causæ, quare propositum aliquod tempus æquari inter-
dum oporteat, altera est inæqualitas dierum naturalium, altera
Meridianorum varietas, quibus inter se versus ortum & occasum loca
terræ discrepare intelliguntur. Sed de varietate Meridianorum postea
dicemus. Nunc breuiter & fontes, & modi eius æquationis, quam fla-
gitat dierum naturalium inæqualitas, exponendi sunt. Etsi autem ab-
surdum videtur eundem motum & per se esse æqualem, & subinde ap-
parere sui dissimilem, tamen perpetua & vniuersalis experientia testa-
tur, non solum quod cœlestes motus videantur nobis dissimiles & inæ-
quales in vno quolibet Planeta, quemadmodum Sol æquales Zodiaci
semicirculos haud æqualibus temporum spatijs permeat: Verum et-
iam quod iidem reuera sint constantes, rati, ac æquabiles, quia mani-
festum est periodos, seu integras cuiusq; planetæ conuersiones æquabi-
litatei quandam inter se conseruare, vt Sol semper annuo, Luna men-
struo spacio percurrit eundem signiferum, cœsi tamen in vna parte or-
bis interea diutius commoratur, quam in alia, quemadmodum in Ele-
mentis & Hypothesibus motuum hæc controversia de dissidio æqualis
& apparentis motus copiose explicatur.

*1. Tempus A-
stronomicum
oportet esse
æquale.*

Hanc ob causam Astronomi in motuum cœlestium inquisitione
primum medios seu æquales motus proponunt, apte & concinne di-
stributos in spacia æqualia temporum, vt annos, menses, dies, & die-
rum scrupula vel horas, deinde vero docent, quantum illis æqualibus
motibus alias addendum sit, alias demendum, vt absque labore obser-
uationis, quem locum vere transeat stella hoc aut illo tempore, Cano-
num duntaxat & numerorum beneficio cognoscatur. Ad hunc enim
prorsus finem Astronomicus calculus dirigitur. Infra autem de veris
motibus dicendi locus erit.

Nunc vt institutum agamus, sciat lector æquales motus tum respon-
dere æqualibus temporibus tum ex canonibus suis aliter excerpti non
posse, nisi æquale fuerit tempus, cui congruens æqualis motus alicuius
stellæ quærendus est. Qua propter Astronomi tum reliquas temporis

*Adparens tē-
pus non est
æquale.*

*Dies natura-
lis Astrono-
micus.*

*Dies natura-
lis adparens.*

*Due causa
inequalitatis*

*Cur Astrono-
mi diei exor-
dium sumant
à meridiano
circulo non
ab horizonte.
Maxima dif-
ferentia inter
adparentes
dies & Astro-
nomicus.*

*III. Tres mo-
di æquandi
dies naturales*

species æquales adsumunt in computatione motuum, tum vero maxi-
mé dies, vulgo naturales, Græcis $\nu\chi\theta\mu\epsilon\gamma\epsilon\varsigma$ appellatos, qui tamen
reuera haud quaquam æquales deprehenduntur, & si hæc in æqualitas
seu differentia nec ita magna est, nec subito sentitur, nisi collatis duobus
inter se diebus non proximis, sed satis longo inuicem interuallo distan-
tibus. Diem enim naturalem æqualem, & aptum numerandis mori-
bus definiunt spacium temporis, quo fit integra cœli vel Aequinoctia-
lis circuli conuersio, ac præterea particulæ æqualis ei, quam Sol in zodi-
aco à medio æquinoctio æqualiter interea confecit. At verus siue adpa-
rens dies naturalis similiter spacium temporis est, quo fit integra æqui-
noctialis conuersio, ac præterea particulæ eiusdem Aequinoctialis quæ
vero motui Solis in Zodiaco ab apparenti æquinoctio respondet, Cum
autem in toto ambitu Aequinoctialis tempora numerentur 360 . motus
autem Solis diurnus æqualis à medio æquinoctio fit scrupulorum 59^1
 8^2 , 20^3 , manifestum est, diem naturalem seu Astronomicum æqua-
lem perpetuo constare temporibus 360.59^1 , 8^2 , 20^3 , sed verus
dies naturalis alias superat hunc medium alias minor est, propter duas
causas, partim quod motus Solis verus, quanquam parum, tamen in sin-
gulos dies variatur bis tantum in anno cum æquali motu congruens,
partim quod segmentis zodiaci etiam æqualibus non tamen æqualia re-
spondent Aequinoctialis circuli segmenta in mundi conuersione. Por-
ro cum ascensionum ratio in Horizonte multipliciter variet pro sphaeræ
obliquitate, in Meridiano autem sit eadem ubiq; locorum, quæ in sphæ-
ra recta, placuit, Astronomis initium diei sumere à Meridiano potius,
quam ab Horizonte, vt omnibus in locis vno eodemq; modo appa-
rens tempus in æqualitatem commutaretur. Caterum hac nostra ætate
maxima differentia inter æquales & apparentes dies contracta est in
tempora 7 . cum 3 . quintis vnus, quæ sanè aliquando supra decem
tempora sese potest extendere. Iam ex his omnibus sequitur, cum ad
præscriptam aliquam veri diei naturalis horam stellarum in cœlo loca
inuestiganda sunt, non simpliciter vtendum esse illa hora, sed eam a-
stronomicæ æqualitati prius conformandam, vt ad talem inquisitio-
nem sit idonea.

Triplicem igitur modum docebimus commutandi apparens tem-
pus in æquale, primum vniuersalem, atq; omnium rectissimum ip[s]is
v[is]itatum artificibus, Ptolomæo, Copernico, & alijs, qui hos sequuntur:
Inde subiiciemus alios duos modos, quos non iniuria dixeris particula-
res, quia singulis ætatibus novos desiderant canones repudiatis prioribus.
Primus

Mediorum locorum vel motuum

145 11 37

Temporum

112 58 45

Excessus mediorum locorum

2 12 52

Ac ex canone conuersionis temporum Aequinoctialis 2. tempora faciunt 8. scrupula prima vnius horæ, scrupula vero prima 12. faciunt 48. secunda & 52. secunda, 7 ferè iidem secunda, quæ in vnam redacta summam exhibent dierum æquationem 8 1^a, 51 2^a, scrupulorum vnius horæ. Aut si mauis conuerrere in scrupula dierum, colliges similiter 22 2^a 8 3^a, scrupula vnius diei. Hæc igitur dierum æquatio ab apparenti tempore subrahenda est eò quod excessus fuit mediorum motuum, non temporum. Antecedit autem hoc tempus natalicium meridiem 17. die Maij, duabus horis anno Christi, 1490. Proinde tempus æquale seu Astronomicum erit ante meridiem eiusdem diei horis duabus ac scrupulis præterea 8 1^a, 51 2^a, horæ vnius. Ad hoc tempus sic emendatum iam recte tum aliarum stellarum, tum præcipue γ -motum inuestigaueris. Eadem vero erit calculi forma, siue ab Olimpiadum siue Nabonassari siue Alexandri, siue Cæsaris, siue alia quacunque Epochæ abste denuo recte constituta æquales motus stellarum deducueris, tantum, vt cuiq; epochæ suus æqualis motus compositus, suaq; veri loci \odot . ascensio tribuatur.

De alijs
epochis.

Hic primus modus perpetuo sibi constans, sicut eruditior est cæteris duobus sequentibus, ita plus etiam aliquanto laboris habet. Subiecimus igitur alios duos modos faciliores quidem, sed quorum canones vni tantum seculo citra errorem inseruiunt, & ad solam Christi Epochæ equaliam motuum spectant, non item ad alias.

Secundus
modus.

At prior quidem proxime ad illam artificum rationem accedens ita se habet. Cum vero loco \odot à vero æquinoctio, qui dato tempore adparenti responder, ingredi canonem priorem equationis dierum naturalium ex Ptolomei doctrina, & obseruata parte proportionali si gradibus veri loci \odot . scrupula adhaerint, in ordine illius signi seu dodecatemorii, & è regione gradus in quo Sol versatur, mox excerpes dierum equationem, quam litera A. addendam, S. vero subrahendam esse monet, vbi etiam Paragraphi nota indicat mutationem additionis in subtractionem, vel è contra. Vt quia in nostro exemplo verus motus \odot ab apparente æquinoctio est part. 6 7. 51 1^a, 32 2^a, id est in 4. gr. 51 1^a, 32 2^a, II. colligo ex dicto Canone æquationem dierum 101 3 2^a, scrupulorum ferè subrahendam ex indicio, literæ S. Hæc igitur Aequatio iuxta secundum modum inuenta non plane conuenit cum equatione primi modi, perinde vt nec sequentis modi equatio. Nam hi duo Canones equationis dierum naturalium sunt à nobis compositi ad annum Christi 1586. potestq; eorum vsus citra insignem errorem annis quinquage-

quingenis ante & post accommodari. Verum quia nostrum tempus annis fere 100. antecedit annum, cui proprie debentur illi Canones, ideo inter ambas æquationes primi & secundi modi interest plus vno integro scrupulo primo, quod ipsum tamen sine aliquo detrimento propemodum negligi potest. Sunt autem tres causæ, quare canones omnes, qui componi in hoc genere possunt sunt temporarij, & vetustate ipsa aboleantur. Prima est instabilitas apogæi Solaris, altera Eccentrotetis orbis solis mutatio, tertia præcessionis æquinoctiorum inæqualitas. Cæterum epochæ omnes, à quibustanquam radicibus in his nostris canonib. equalis motus Planetarum ad quolibet tempora vel præterita vel futura propagantur, accommodatæ sunt penitus ad primum modum. Secundus autem modus æquationis dierum spectat ad solam epochen æqualium motuum Christi qualis ea in aditu Canonum æqualiū motuum inter cæteras posita est. Alia vero res est in eo modo, qui nunc sequitur.

TERTIUS igitur modus longius ab artificium via recedens sic tractatur. Posteriores canonem æquationis dierum, factum scilicet ex Regiomontani doctrina & recentiorum sententia ingredi, ut prius cum vero loco ☉ ab apparenti æquinoctio, ac rite inuentam æquationē dierum perpetuo aufer ab apparenti tempore. Ita enim prodibit æquale tempus quo recentiores vtantur. Igitur cum 4 gr. 51 1^a, 32 2^a. II. ingredi-
enti canonem, ut decet offeruntur 18 1^a. 17 2^a, scrupula auferenda à tempore nostro apparenti Natalicio. At in secundo modo erant tantum 0 1^a, 32 2^a scrupula, vnde hæc inquires, dissimilitudo est. quod in hoc tertio modo maior existit æquatio. quam in secundo, scrupulis nimirum 8 1^a, 9 2^a. Dicam breuiter, quod res est, à paucis etiam, qui inter doctos numerantur, satis animaduertum, Recentiores vt à molestia primi modi liberarent eos, qui ex alphonfino abaco cœlestes motus numeraturi essent canonē temporarium condendum censuerunt, id quod à nobis etiā duplici via factum esse vides. Sed cum in priorimodo nostro quanquam facili, illud tamen scrupulum iniicere potest hominī patum exercitato quod, ut æquale tempus efficiatur, æquatio addenda alias est, alias vero, subtrahenda cognosce bone lector, qua ratione huic imbecillitati discentium consuluerint, ut sola tantū subtrahitione perpetuo ac constanter hoc negotium expediretur. Quanta erat maxima dierum æquatio addenda, ei congruentes æquales motus singulorum planetarum epochis adijci-
ebant, tamen epochæ ipsæ per se hoc minimè postulabant. Itaq; cū ipsi epochæ seu initio motuum æqualiū semel additum est tantum, quantum ut cum maxime addi conueniebat vno duntaxat die toties anni. ideo necesse est deinceps singulis diebus totius anni subtrahi, dierum æquationem ab apparenti tempore, ut inuestigati motus ex canonibus recte congruant cum tempore proposito. Hoc est illud, quod Regiomontanus
noster

noster docet, si radix temporis posita sit super principium diminutio-
nis æquationem dierum semper subtrahendam esse, vt ex differentibus
diebus fiant mediocres, & contra addendam mediocribus vt fiant dif-
ferentes, quos vocamus apparentes. Contrarium autem sit, si radix
temporis posita fuerit super principium additionis. Visa est autem eis
aptior in hac tractatione via subtractionis, quàm additionis, eò quòd
maxima æquatio subtrahenda superat maximam addendam, tum et-
iam quod in pluribus signis zodiaci vel maiore parte anni aufertur æ-
quatio, quam additur, quemadmodum ex priori canone satis perspicu-
um est.

Verum vt hæc obscurius dicta fiant quàm planissima simul etiam,
vt id quòd reliquum est in hac explicatione, absoluat, rem ipsam,
quantum huius instituti ratio patitur, ante oculos statuemus. Ad ini-
tium annorum Christi æquales D motus sub meridiano Regiomon-
tano infra sic posuimus.

	Sex	par.	I	II	III	IIII
Medius motus longit. D à \odot	3	29	58	22	36	56
Anomalix D .	3	27	13	27	41	16
Latitudinis D .	2	9	41	50	37	59

Hæc Epoche, qua æquales D motus initio annorum Christi adfixi
sunt, conuenit primo modo æquationis dierum quemadmodum & aliæ
omnes Epochæ omnium æqualium motuum. Secundo autem modo
hæc ipsa sola conuenit, non aliæ quoq; vt prius dictum est. Tercio au-
tem modo nequaquam conuenit, nisi prius hæc correctio adhibe-
atur, quæ nunc sequitur. Maxima dierum æquatio addenda ex priori
canone colligitur in 22. parte ss scrupulorum 8 1^a, 9 2^a, vnus horæ.
Huic æquales D motus respondent.

	I	II	III	IIII
Longitud. à \odot	4	7	52	43

Latitud.	4	28	59	48

EPOCHÆ Quæ addita superioribus numeris singula suo loco constituunt
æqualium motuum D epothen æqualium motuum D quæ propriè huic tertio modo æquati-
onis conuenit, nempe.

	Sex.	Part.	I	II	III	IIII
Longitud. à \odot	3	30	2	30	29	39
Anomalix D	3	27	17	55	20	35
Latitud. D	2	9	46	19	37	47

Ad consimilem modum emendabis, si lubet, æquales motus cæte-
rorum planetarum initio annorum Christi affixos seu alligatos, & si
hæc

hec scrupulosa diligentia ob motus eorum tarditatem parum est necessaria. Sed de luna admonitos volo omnes, qui in his nostris tabulis tertio modo æquationis uti volunt, ut hanc correctam epochen æqualium motuum nec aliam ullam suæ supputationis initium statuunt.

Ex his iam intelligi potest, quare tertius modus antea obijciebat maiorem æquationem subtrahendam, quam secundus, scrupulis scilicet $81^a, 92^a$, vnius horæ. Quia enim epochæ & ut vulgo vocant, rationes æqualium motuum iam sunt posteriores factæ, quam in primo & secundo modo scrupulis $81^a, 92^a$, vnius horæ, ideo deinceps semper totidem scrupulis distat huius tertij modi æquatio subtrahenda ab æquatione secundi modi. Ut principio Arietis in secundo quidem modo congruit dierum æquatio $01^a, 552^a$, vnius horæ addenda, sed in tertio $71^a, 142^a$, subtrahenda, quæ addita inuicem conficiunt $81^a, 92^a$, scr. Similiter ad 10. gra. ✓ æquatio dierum secundi modi habet $21^a, 152^a$, subtrahenda, tertij autem $101^a, 232^a$, similiter subtrahenda quorum minus ablatum à maiori relinquit eundem $81^a, 82^a$, Nam ut diuersæ species per additionem, ita similes per subtractionem ostendunt suam differentiam.

Hæc de via subtractionis, quam recentiores in scholas introduxerunt, commemorare nunc breuiter volui, à paucis recte tradita, quæ quidem omnia iuxta viam additionis contrario se modo habent, id quod hoc loco monuisse satis est, Nam alibi hæc à nobis copiosius, Deo iuvante, explicabuntur, monstrata etiam ratione, qua novos canones vtriusq; modi proprios cuiq; seculo vel ærati hominum condere quam facillime liceat.

Verum hic tandem obijciat aliquis, cur primo loco positum sit à nobis præceptum de æquatione dierum, cum dato tempore apparenti non mox una detur verus locus ☉ à vero æquinoctio, cuius tamen noticia in omnibus tribus modis necessaria est? Multo igitur rectius videtur, ad quodcumq; datum tempus apparens supputare coelestes motus & postea, ubi hoc factum fuerit, uti dierum æquatione. Fateor veram esse hanc obiectionem, sed hanc ipsam ob causam volui ante omnia de dierum æquatione monere studiosum lectorem, ut sciret motus supputatos ad apparens tempus non congruere ei ante, quam hæc censura adhibeatur. Quare in fine huius præcepti summam rei breuiter complectar.

Primum constat, vel mediocriter in elementis harum arrium versatum non magno labore coniectare posse locum ☉ propemodum congruentem dato diei mensis, cum passim in omnibus diarijs notetur introitus ☉ in singula dodecatemoria Zodiaci. Deinde & dierum æ-

Consensus se-
cundi & ter-
tij modi.

De via addi-
tionis.

Summa rei.

De secundo
& tertio
modo.

quationem intra biduum parum mutari ex utroque canone appareat
ut maxime circa verum locum ☉ aliquantulum hallucineris. Quare
non dubium est, vtiliter & compendiose proponi hos canones æquati-
onis dierum temporarios, quibus quomodo vtendum sit odiosum esset
denuo repetere.

*De primo
modo. 1. Si
ad datum
tempus qua-
runtur mo-
tus.*

Sed si maius vti illa prima ac erudita artificum ratione, ita sané-
cito ad datum tempus adparens perinde ac si æquale esset, absolvas cal-
culum verorum motuum ☉. ♃. & reliquorum planetarum. Postea
si primus modus iubeat dierum æquationem subtrahere, quantus ei
æquationi motus æqualis respondet, tantum aufer à veris locis seu mo-
tibus singulorum planetarum. Sed si addenda fuerit æquatio, respon-
dentem illum æqualem motum similiter adiunge ad veros motus pla-
netarum, maxime vero ♃. quia in cæteris planetis tam accurata dili-
gentia non multum adfert momenti. Hæc præcepta sequere, quoties
quæritur, qui verus motus congruat vel accommodatus sit ad datum
tempus. Ad data enim accommodari solent ea, quæ inquiruntur. Hu-
ius rei exemplum infra lectori dabimus in calculo motus ♃.

*2. Si ad da-
tos motus ve-
ros quæritur
adparens
tempus.*

Sin autem contra quæritur, quod tempus verè congruat datis veris
motibus planetarum, tunc æquali tempore, quod simul datur cum ve-
ris motibus simpliciter adde ipsam dierum æquationem, si addenda,
vel aufer subtrahendam. Ita enim conflabis adparens tempus, cui ex-
hibiti veri motus debentur. Vsum, habet hoc posterius præceptum in
Eclipsibus, ac in vniuersum in nouilunijs ac plenilunijs, ut suo loco
docebimus. Quando autem vtendum sit additione vel subtractione
æquationis, petendum est ex regulis, quas supra in primo modo tra-
didimus. Quod enim ad secundum & tertium modum attinet, Cano-
nes ipsorum per se hac de res satis docent.

Hæc de dierum æquatione initio commemoranda duxi, quæ etsi
prolixiora fuerunt, tamen arbitror eorum cognitionem studioso le-
ctori, ac candido non fore ingratam.

2

SECUNDVM PRAECEPTVM DE AEQVANDO

tempore ob varietatem meridianorum.

*Non idem
meridianus
vbiq.*

Est & altera causa, quare datum tempus æquari conveniat, varie-
tas scilicet Meridianorum. Nam quia Eclipses Lunares non eodem
tempore conspiciuntur vbiq., sed ita, ut in eiusdem Eclipsi observa-
tione, ij qui à nobis habitant versus ortum, numerent plures horas, si-
ue ab Horizonte, siue à Meridiano, pauciores autem, qui versus occa-
sum, manifestum est loca terræ, quæ distant inuicem versus ortum &
occasum discrepare Meridianis circuli. Ac distantia quidem duorum
quorum li

quorumlibet Meridianorum inter se vocatur differentia longitudo, quæ definitur arcu vel Aequinoctialis circuli, vel paralleli verticalis alteri locorum inter eosdem Meridianos intercepto. Sicut autem in quoridiana mundi conuersione, ita in hac quoque consideratione 15. tempora siue Aequinoctialis siue alterius cuiuscumque paralleli vni horæ tribuuntur, eo quod totius Aequinoctialis ambitus in 24. horas, distribuitur. Verum ne opus esset hac conuersione temporum in horas, earumque scrupula, posuimus in catalogo locorum differentiam temporis congruentem differentiae longitudinis.

Cum autem Epochæ æqualium motuum omnes accommodatae *Meridianus Regij montis Borussia.* sint nobis ad Meridianum Regijmontis inlcytæ vrbis Borussiae oportet aliorum locorum tempora seu horas ad eundem Meridianum Regijmontis coaptare. Potest autem & huius præcepti æquatio duplici ratione perfici, sicut præcedentis. Aut enim ad Meridianum Regijmontis iuxta tabularum rationem computare liber motus cœlestes, & eosdem referre postea ad alios quoslibet Meridianos, Aut primo & immediate ad alium Meridianum propositum. Modus computati ad Meridianum Regijmontis dupliciter referri possunt ad alios Meridianos, seu alia loca, vel ut idem numero motus diuersis horis congruat, vel ut iisdem numero horis diuersi respondeant motus. Ut idem motus congruat diuersis horis, adde differentiam temporis in locis orientalibus, & subtrahe in locis occidentalibus eo quod loca orientalia plures numerant horas occidentalia pauciores, ut dictum est. Et ad hunc casum propriè destinatae sunt notæ A & S in catalogo regionum seu locorum, A ut nota additionis, S subtractionis Verbi gratia sit ad datum tempus Regijm. motus D in 12. gr. 20, 1^a, 27 2^a, 8, ac libeat cognoscere, cui horæ sub Meridiano Onolsbachij idem D. motus congruat, vides in Canone regionum iuxta Onolsb. sub titulo tempus scribi o. H. 56. 1^a, cum litera S. Ideo scr. 56 1^a, aufer à tempore, quod Regiomontia Meridiano numeratur porrò, vel iuxta cœli conuersionem. Relinquetur enim tempus quod sub Meridiano Onolsbachij quadrat ad inuentum motum D.

Ut autem iisdem numero horis congruant motus, in Lunæ quidem motu, pro binis scrupulis differentiae temporis singula scrupula partis adde motui, si locus alter, ad quem motus propriè non erat calculatus, fuerit occidentalis, sed aufer, si fuerit magis orientalis, vel ex tabulis æqualium motuum collige motum respondentem differentiae temporis, eumque adde vel subtrahe, ut dictum est Idem etiam si videbitur facito in cæteris planetis, præsertim si temporis differentia fuerit aliquius momenti, ut sit motus D. inuentus ad horam decimam à media nocte Onolsb. par. 12. 20 1^a, 27 2^a, 8. ac velim scire qui motus congruat

ad eandem horam Regijmontis. Quia differentia vtriusque Meridiani est 56 1^a, vnius horæ, ac Regius mons orientior, aufer à motu D 28 scrupula prima partis, vt semissem 56 1^a, scr. horæ. Erit ergo verus motus D ad eandem horam decimam Meridiani Regijmontis part. 11. 52 1^a, 27 2^a, scr. 8. Sed vt immediate ad datum Meridianum aliam quam Regijmontis numerare queas motus, quare eum in catalogo locorum vel ei propiorem, & differentiam temporis iuxta scriptam cum sua litera excerpe. Eam differentiam adde Tempori alterius loci, si adfuerit S. vel aufer, si A, ita vt contrarium ipsius notis facias. Verbi gratia. Inclytus Dux Borussia natus est Ono Isbachij horis decem post medium noctis, estq; differentia temporis 56 1^a, scr. iuxta Onolsbachium cum litera S. Igitur 10. horis adiunge 56. scrupula & ad hoc collectum tempus inuestigatus D motus immediate respondebit decimæ horæ Onolsbachij, scilicet 12. part. 20 1^a, 27 2^a, scr. 8.

Inest autem in hac posteriori ratione, primum hoc boni, quòd Epochæ æqualium motuum non mutantur, sed relinquuntur, vt a nobis ad Regijmontis Meridianum sunt accommodatæ. Deinde hac vnica temporis emendatione omnium postea planetarum veri motus correcti existunt, vt citra aliam calculi censuram proprie apteq; illius alterius loci Meridiano respondeant.

DE GEOGRAPHIA.
PHIA.

Cæterum quod ad nostrum regionis seu locorum canonem attinet fateor meo animo haud satisfactum esse, etsi secutus sum eos, quorum sententiam hoc saltem tempore cæteris prætuli. Vtinam vero Geographicum quoque studium hoc nostro seculo non obiter tantum, sed vera ac iusta diligentia tandem etiam colatur, nempe vt artifices in diuersis Europæ regionibus & locis plures ac eosdem D. defectus accurate obseruent, eaque intentione & iudicio vt plurimum obseruationum collatio singulis in locis suo eodemque modo vel congruat ad calculum, vel discrepet. Etenim si de paucis locis Hispaniæ, Galliæ, Italiæ, Germaniæ, vicinorumque regnorum artificum suffragia ex talibus obseruationibus collecta inter se congruerent, postea ex Geometricis fontibus longitudinum differentiæ corrigi & exacte constitui possent addita itinerum ratione, quæ non obscura est. Quis enim ex eruditissimis absque stomacho legit tantam scriptorum in hoc genere discordiam? Inter Romam & Noribergam faciunt alij longitudinis differentiam 9. temporum, alij 8. alij 7. tantum. Anconam & Romam in Italia collocat Ptolomæus sub eodem fere Meridiano. At recentiores non solum à Ptolomæo, sed inter sese plurimum variant, vt in exigua distantia, quæ penè citra coelestem obseruationem iudicari potest. Sed desino recitare exempla dissensionum, quæ nimis multa sunt. Quod si docti viri

virī passim in hoc Geographicum studium incumbent maiori intentione, id quod paucos quosdam magna cum laude facere scio, arbitror Regum ac principum quorundam liberalitatem ipsorum laboribus, ut par est, non defuturam, videmus enim nonnullos Regum ac Principum deditos esse his Philosophicis studiis, ac cultores eorum liberaliter fouere. Etsi autem præmia satis digna tantis laboribus fortasse non contingant ab ijs, qui opes tenent ac imperia, tamen nos, qui in hanc discendi ac docendi stationem collocati sumus, nostrum munus propter mandatum Dei sedulo ueri decet, ut veritatem in omnibus bonis artibus, & inquiramus magna studiorum contentione, & inuentam alijs monstremus. Labor enim noster non erit inanis in Domino, ut Apostolus inquit.

TERTIVM PRAECEPTVM DE

accommodatione temporis ad usum calculi æqualium motuum, tam iuxta Alphonsinam rationem, quam Copernici.

Ex canonibus æqualium motuum triplici via colligi possunt æquales motus dato quolibet tempore. Prior vulgaris est, ac tempore oblato iuxta Ecclesiæ & Calendarij consuetudinem sine ulla mutatione vitur. Posteriores duæ plus artis habent, quarum altera propria est Alphonsinorum, altera peculiaris Copernico cæteris duabus fermè compendiosior. Sed datum tempus in vtraque harum seu præparare prius seu accommodare oportet ad usum calculi. Quia in re etsi ingeniosis, qui numerorum usu instructi sunt, bona ex parte non sit opus subsidio aliquo, præsertim iuxta Copernici viam, tamen vtriusque viæ Canonem tibi inter cæteros exhibuimus, ne quid desit ad expeditum calculum, quacunque via uti voles. Consultum est autem relictis cæteris, ad vnam harum te adueneri, ut eam ita probe tibi reddas familiarem ut possis stellarum positum tum in cælo, tum inter se, quoties usus postulat, non tantum celeriter, verum sine scrupulo atque hesitatione ulla ex his tabulis depromere.

Ante omnia autem hæc tria semper meminisse, ac considerare oportet, Primum quod æqualium motuum Epochæ aliæ ex meridie, aliæ à media nocte initium capiant, à Meridie quidem hæ tres Olympiadum, Nabonassar, & Alexandri sed à media nocte antecedenti reliquæ duæ, C. Cæsaris, & CHRISTI. Domini ac Saluatoris nostri. Alterum est, quod dum laboramus tempus vulgare datum præparare ad usum calculi omnes temporis species complete accipiendæ sunt.

Sæpe enim in communi sermonis consuetudine, cum specie hac vel illa temporis fieri, aut factum esse aliquid significamus, non finem illius speciei intelligimus, sed momentum aliquod in illa specie tanquam indiuiduum comprehensum. Vt cum dicimus aliquid gestum esse hoc aut illo anno, mense, die, hora denique, non mox intelligi volumus exitum anni, mensis, diei, & horæ, sed illud ipsum momentum quod ab extrema minimaque specie planè designatur, vt si dicam Inclitum Borussiae Ducem natum esse in hanc lucem anno Domini 1490. die 17. Maij horis 10. ante meridiem, hic nec anni, nec menses, nec dies, vt numeris exprimuntur, pleni accipiendi sunt. sed in vna qualibet specie accipiendus est numerus, qui proximè antecedit. Itaque hoc ipsum tempus sic concipiendum est, vt intelligantur anni pleni 1489. menses 4. scilicet vsq; ad finem Aprilis, inde dies Maij 16. & horæ, præterea decem, vt à media nocte, vnde diei exordium sumere nos in hac Christi epoche modo dictum est. Tertio cum annorum Iulianorum alius communis sit alius bisextilis, communem vno die excedens, huius quoque rei, vbi ad menses ventum est, rationem habere oportet, vt conuenienti tabella mensium vtaris, ne in hac temporis metamorphosi seu permutatione integrum diem vel amittas, vel incommode lucrifacias. Scito autem bisextilem annum existere eum, cuius numerum pendentem ab initio annorum Domini quaternarius metitur. Reliqui omnes anni medij sunt communes, vt anni 1488. 1492. sunt bisextiles Annus ergo Domini intermedius 1490. communis est.

*Prima forma
Alphon-
siorum*

Iam vt breuiter accipias rationem, quomodo datum tempus Alphonfino abaco fiat accommodatum, primo considera partes canonis conuertendi annos Iulianos in dierum sexagenas, altera enim pars eius habet εκατοῦταετηρίδες, id est centenis annis perpero assurgit, vel propagatur tanisper, donec ad tres chiliades annorum perueniat altera vero pars annos simplices vel singulos vnus εκατοῦταετηρίδας continua serie proponit, additi sunt simul & menses anni Iuliani tum simplicis tum bisextilis. Similis forma est sequentis canonis conuertendi Iulianos annos Aegyptios & eorum sexagenas, verum hos ambos sequitur canon cuius duæ sunt partes, prior expeditè seruit conuersioni horarum & scrupulorum vnus horæ in scrupula dierum. Posterior autem conuersioni scrupulorum vnus diei in horas, & horæ vnus scrupula, sed prior pars præcipue vsum habet siue Alphonfino abaco, siue Copernici datum tempus fuerit accommodandum.

Quod reliquum est huius præcepti vno exemplo discès multo rectius, quàm proluxa oratione, quæ res per se tenues, nisi exempla adhibeantur, sæpe obscurat potius, quàm illustrat. Propone ergo tibi absolutum

Iutum tempus, vt dixi annos 1489, menses 4, dies 16, horas 10, & scrupula 56 vnus horæ. Ex canone autem anni 1400, sunt 2. sexagenæ tertiæ, 22. sexagenæ secundæ, 1. sexagenæ primæ, 30. dies, Anni 89, similiter sunt 9. sexagenæ secundæ 1. sexagenæ primæ, 47. dies, Menses autem quatuor, vt in anno communi, sunt 2. sexagenæ dierum, in de subijce dies 16. per se. Ex canone autem conuersionis horarum, decem horæ sunt 25. scrupula prima diei, deniq; 56. scrupula prima horæ sunt 2. scrupula 1^a, & 20 2^a diei. Hæc omnia coniecta in vnam summam, seruato & ordine & discrimine specierum, vt supra in additione præcepimus, sunt 2. sexagenæ 3^a, 31 sexag 2^a, 6. sexag. 1^a, dies 33, 27 1^a, 20 2^a.

	Sex.	3 ^a	2 ^a	1 ^a	Dies	scr.	1 ^a	2 ^a
Ann!	1400	2	22	2	30			
	89		9	1	47			
Menses	4			2	0			
Dies	16				16			
Horæ	10				0	25	0	
Scrup.	56						20	
Summa.		2	31	6	33	27	20	

Altera autem Copernici forma planè similem tractationem habet, *Secunda forma Copernici.* nisi quod a lter canon hic vsurpanus est, nempe conuertendi annos Iulianos in annos Aegyptios & eorum sexagenas. Nam posterior ille canon conuersionis horarum pariter seruit viriq; formæ. Proinde idem tempus natalicium Inclÿti Ducis ac Mecenateis nostri ad vsum calculi ex Copernici instituto sic accommadabis, vt hic subiei, quia præter exemplum nihil desiderari potest.

	Sex.	1 ^a	An.	Sex.	Dies	Scr.	1 ^a	2 ^a
Anni	1400	23	20	5	50			
	89	1	29	0	22			
Menses	4			2	0			
Dies	16				16			
Horæ	10				0	25	0	
Scrup.	56					2	20	
Summa		24	49	8	28	27	20	

Tempus igitur aptum calculo Copernici erit 24. sexagenæ primæ annorum, 49. anni Aegyptij, 8. sexagenæ primæ dierum, dies 28, scrupula prima 27. secunda 20. vnus diei.

Adieci

*Canon ver-
tendi anni
Egyptios in
dies & eorum
sexagenas.*

Adiecimus autem hisce canonibus & alium conuertendi annos Aegyptios dies & eorum sexagenas cuius vsus etiam alicubi, praesertim in Ptolomæi lectione esse potest, qui cum similis sit prioribus satis iam manifestus est. Nunc proximum erat medios motus colligere, nisi pauca quædam alia, quæ ad temporis rationem spectant, nec alibi commodius reponi possunt, prius percurrenda essent, vt sequens tractatio motuum penitus inter se cohæreat.

DE EPOCHIS ET EARVM

interuallis.

III.

*Ecclesie pia
consuetudo.*

*Cur ad initium
annorum
Christi omnia
sint referenda*

Nulla fuit gens vnquam tam barbara, vel adeo sine sensu omni humanitatis quin vellet Originem suam sciri, & aliquam sui memoriam propagari ad posteritatem. Quam ob causam tum alia multa sunt à diuersis gentibus excogitata, vt insignium rerum ac euentuum præteritorum noticia quamulacunque perveniret ad posteros, tum vero hoc prudenter & vtiliter institutum est, vt vel à rebus gestis alicuius Heroici viri, vel ab auspicijs alicuius regni & conditæ vrbis, vel alio quocunque memorabili casu generis humani annorum series deduceretur. Sed vt in Ethnicis historijs omnia sunt plena caliginis & confusionis, nec vlla annorum certa & constans ratio, ita sola ecclesia veram atque certam, licet breuem, historiæ totius mundi seriem in diuinis libris notatam habet. Ac primi quidem patres annum numerarunt à mundi creatione, non solû vt mundi ætas ac duratio sciretur ad posteros, & si hoc sane præclarum & ingens bonum est, sed multo magis, vt & de horribili lapsu primorum parentum, & de admiranda Dei misericordia ostensa in promissione seminis admonerent vniversam posteritatem. Quare deinceps & à diluio, & ab Abrahamo, & à promulgata lege & à condito templo Solomonis. & à captiuitate Babylonica, & ab alijs insignibus seu impiorum poenis, seu Ecclesie liberationibus seriem annorum publice annotauit Ecclesia, vt hi velut tituli annorum de ira, & beneficijs ac patefactionibus Dei omnibus hominibus concionarentur. Verum nulla res à condito mundo accidit nec illustrior, nec admirabilior natiuitate Filij Dei Domini nostri IESU CHRISTI, quem Deus pro sua inenarrabili misericordia voluit victimam fieri vniuersi mundi pro peccatis generis humani, ne totum cum diabolis petiret prorsus, sed aliqua pars, quæ huic se liberatori ac Domino vera fide atque inuocatione adiunxisset, seruata ex communi interitu æternæ vitæ ac gloriæ consuetudine societateque donaretur. Quare vt prima ecclesia ingenti spe atque expectatione annorum seriem continuauit à prima

prima feminis promissione. Ita huius postremi temporis Ecclesia recte numerat annos à natali sui regis ac liberatoris vniuersæ Ecclesiæ, vt & fidem accendat perpetua recordatione, & expectet eundem Messiam breui apparituum, vt ornet pios æterna vita ac gloria.

Hanc igitur Ecclesiæ consuetudinem nos etiam in computationibus cœlestium motuum merito sequimur, vt Dei Creatoris, ac liberatoris nostri immensa beneficia hac quoq; parte, quamuis exigua, prædicemus. Nam & retrò à natali Christi commodissime motus ex his canonibus numeraueris, adhibito anno Iuliano, perinde ac si semper & ubiq; in hominum vsu fuisset, quia huius anni ratio est haud sanè eruditissima est, tamen præ cæteris aliarum gentium annis propriam hanc habet commoditatem, quod æquinocchia & solsticia quotannis propemodum statis diebus recurrunt, nec nisi longo annorum circuitu velut ægrè abijdem diuelluntur. Ideoq; hic annus Iulianus solus ex ciuilibus aptissimus est, ad numerandam mundi durationem, & vt res gestæ singulorum hominum & ætatum annis suis recte attribuantur.

*Commoditas
anni Iuliani*

Sed tamen non à solo initio annorum Christi deducimus tibi æquales motus, verum huic Epochæ alias quatuor adieci, Olympiadum scilicet Nabonassari, Alexandri & C. Cæs. secutus ea in re vt in alijs Nicol Copernic. virum omnium sæculorum memoria dignum, quem adparet non sine graui consilio hæc potissimum tempora in tam multiplici rerum memorabilium copia elegisse, sed Nabonassari quidem initium maxime ob Ptolemæi lectionem, tum verò omnia tempora simul propter historias, partim Græcas, partim latinas.

Ac epocharum interualla, ex ipso Canone, quem infra posuimus, satis manifesta sunt, nec desiderant aliam explicationem. Verum pauca quædam hic breuiter adijcienda sunt admonendi lectoris gratia, cui parum notæ sunt historiæ.

Agona olympicum ante bellum Troianum Hercules in honorem atauis materni Pelopis primus edidit, quem diu intermissum ab excidio Troiæ anno 408. Iphitus tandem instaurauit, deficientibus iam & regibus Lacedæmoniorum, & regno Corinthiorum, vt & in Functi Chronologia eruditè annotatum est. Atq; hæc fortasse occasio fuit, est alia multa insignia in eadem tempora inciderunt, vt natiuitas Romuli, qui fuit *duxis* huius urbis Romæ, victoris postea orbis terrarum. Cum autem Grecorum annus esset ad Lunares menses propriè accommodatus, vt perpetuo sibi constaret, & aliqua ex parte simul ad Solis annum cursum conueniret, desiderabat non solum mensem, verum etiam diem *ἐμ βόλιμου* seu intercalarem. Quare sapiens antiquitas, cum videret omissione diei intercalaris turbari totam anni &

Magnus.*

nouiluniorum rationem, instituit hoc quadruplex certamen quarto quoq; anno, id est, sub exitum cuiusq; Olympiadis celebrandum, vt memoriam diei intercalaris ex 4. quadrantibus collecti tam insigni spectaculo vniuersa Græciæ posteritas velut positam haberet ob oculos. Ac mensis quidem intercalatio facta est, aliàs secundo, aliàs tertio anno, ita vt & solstitia & æquinoctia perpetuo intra certos dies suorum quæq; mensium vltro citroq; oberrarent, diei verò intercalatio quarto quoq; anno cuiusq; olympiadis, vt initia mensium constanter nouilunijs responderent, fuitq; initium anni Attici ab æstiuâ conuersione Solis, ac primo mensi nomen Hecatombæon. Hæc nunc breuiter de Olymp.

Nabonassar, Ptolemæi in sacris literis non est Nebucadnezar, seu Nabugdonosor, qui euerit Hierosolymas, sed Salmanassar, qui triennio obsessam Samariam cepit, & decem tribus abduxit in Assyriam, quod & historiarum collatio atq; series ostendit, & motus ipsi in coelo testantur cum Ptolemæi narratione congruentes, verum de motibus quisq; pro suo ocio periculum fecerit. Sed quod ad historiam attinet primum Mardocempadus cuius vt Babylonici regis annos in trib. deliquis numerat Ptolemæus, eumq; Nabonassaro 26. annis posteriorem facit, alius esse non potest, quam qui tum à Metasthene & alijs scriptoribus, tum verò in sacris literis Merodach nominatur, quæ simul docent eum ad Ezechiam regem Iuda gratulatum misisse de admirando regressus Solis phænomeno. quod ipsius nomine diuinitus ostensum esse fama acceperat. Et si aut hoc ostentum fortasse non ubiq; animaduersum est, vt sumus pleriq; omnes in consideratione diuinorum operum nimis oscitantes, tamen Chaldeos, homines ea tempestate coelestium rerum peritissimos, & sagacissimos huius præposterii motus Solis aspectu vehementer percussos & attonitos fuisse nihil dubium est. Hæc autem omnia gesta esse post fœdam fugam impij Sennacherib à Hierosolymorum obsidione destructo iam regno Israel à Salmanassare, aperte docent sacræ litæ. Primus autem hic Salmanassar ex regibus Assyriacis videtur propter magnitudinem rerum à se gestarum in vicinia nomen suum ad Aegyptios quoq; extendisse, cum superiorum regum fama fuisset in occidente obscurior. Similiter & Ptolemæus Nabopolassarem posteriorem facit Nabonassaro annis 122. quem admodum sacra Biblia indicant, quod Nabugdonosor vsurpauerit Babylonicum imperiū post Salmanassarem regem Assyriæ annis fere 100. vt nunc sanè momenta temporū non nimis subtiliter cōstituamus.

Alexandrum historiæ omnes magno consensu tradunt regni Macedonici habenas suscepisse Olympiade 111. & mortuum Olympiade 114. quorum vtrumq; de primis earum annis accipientum est. Tan-

tas igitur res quibus antecellit omnibus sanimis bellatoribus omnium ætatum gessit omnino annis 12. mensib. 8. vt refert Arrianus. Et quia Babylonia positus est 6. annis ante obitum, inde suarum periodorum initium facit Calippus, sed ita, vt anni exordium esset ab æstiuæ conuersione more Atheniensium, non prima a die mensis primi Thoth Aegyptiorum, vt in annis, qui ab Alexandri obitu relati sunt in litteras. Constabat autem vna periodus Calippi annis 76. id est, quatuor annis magnis Metonis, qui alias vocantur *ἑννέαδεκάετηρος*. Hic fortasse de annis Chaldaeorum. & qui numerantur secundum Dionysium, quorum apud Ptolemæum, item de annis Ad hilcarnæ, in quorum apud Albategnum crebra sit mentio, aliquid dicendum erat. Verum hæc in alium locum reseruamus, ne a proposito nunc nimis procul euagemur.

Illud tamen silentio non possum hic præterire, quod apud Censorinum & alios doctos anni ab obitu Alexandri vocantur & anni Philippi, qui est Aridæus frater Alexandri, cuius nomine ac titulo principes socij; Alexandri regna armis domita 7. annis administrarunt. Quo in loco Alphonsini ex historiarum inscitia errant 12. integris annis in temporum ratione, huius Philippi Aridæi nomen transferentes ad Philippum patrem Alexandri Magni.

Olympiadum anni sunt Lunares ad solis tamen cursum utcumq; accommodati, quorum initium Attico more semper à meridie primi diei Hecatomæonis, & conuersione Solis æstiuæ proficiscitur. Anni à Nabonassaro & ab obitu Alexandri Magni apud Ptolemæum sunt Aegyptij, quorum initium non pender ab aliqua quatuor troparum anni circuitus Solis, sed à meridie primi diei Thoth, qui singulis quadriennijs vnius diei interuallo anticipans à consequentibus recedit in antecedentes.

Anni verò Iuliani & Christi nec sunt Lunares, nec Aegyptij, sed solares ciuiles, quos C. Iulius Cæsar primum non sine graui consilio instituit, ita vt alij sint dierum 365. alij autem (vt quartus quisq;) 366. eam ob causam, vt Aequinoctia & Solstitia ab ijs diebus quibus semel adhæserint, non nisi longo annorum tractu recedant in præcedentia.

Esti autem annorum historiam alibi copiosius explicare decreui, id tamen nunc monere visum est, quod in primo anno Iuliano tria fuerint maximè memorabilia, Adhibuit enim Cæsar in hac anni ordinatione Sosigenem artificem ea tempestate insignem, vt non temere apud Lucanum gloriatur. Nec mens Eudoxi fastis superabitur annus. Primum est, quod ab initio Olympiadum ad initium annorum Iulij sunt pleni anni Aegyptij 730. Alterum, quod in hoc pri-

phonfi.*

mo anno primus dies Hecatombæonis Atheniensium congruebat ad primum diem mensis Quintilis. Et hæc causa est, vt cætera nunc omittam, quod Quintilem voluit à se Iulium cognominari. Itaq; cum per annos Aegyptius 730. iuxta Olympiadum rationem intercalati essent dies 182. totidem etiam dies in hos 6. menses, Ianuarium, Februarium, Martium, Aprilem, Maium & Iunium secutus Romanam quandam rationem coniecit. Postremum est quod è prima Olympiade vsq; in primum diem Quintilis primi anni Iuliani dimidium anni 730. Aegyptiorum peractum fuit, qui continet annos Aegyptios quidem 1461. Iulianos verò tantum 1460. principium trahens illis temporibus ab exortu Caniculæ. Ex his iam perspicuum est, quod principium Iuliani anni magna solertia partim ad Græcum, partim ad Aegyptium annum fuerit accommodatum. Breuiter nunc hæc commemoro properans ad sequentia. Initium verò anni Iuliani similiter & CHRISTI non pendet à meridie Calendarum Ianuarij, sed à media nocte antecedenti iuxta Romanam consuetudinem.

De initio annorum CHRISTI satis iam dictum est, quantum hic locus requirit, nec ferè quisquam ignorat, quod primum annum Domini antecesserit proximè annus Bisextilis.

Numerantur autem à condito mundo ad diluuium anni	1 6 5 6
A diluuiò ad exitum ex Aegypto, seu primum Pascha	7 9 7
Inde ad initium annorum Christi.	1 5 0 9
Vt sint à condito mundo ad CHRISTVM IEHOVA	3 9 6 2

Fortasse hic etiam non omittendum est, quod ab initio annorum CHRISTI numerent ad initium annorum Arabum dies 227015. id est annos Aegyptius 621. diesq; 350. & inde porro ad initium Persarum dies 3624. id est, annos Aegyptios decem, minus diebus 36. Annos Arabum vocant Alhegera, id est. seditionis vel seductionis blasphemæ Mahometi, & Persarum annos Iesdagert. Cum autem æræ (vt vocant) ex Alphonfi sententia admodum deprauatæ circumferantur, etsi earum non magnus vsus est, quod interualla earum à veritate historica plerumq; dissentiant, tamen eam quoq; tabulam ex antiquissimo codice manu scripto in fine huius nostri operis emendatum adiecimus, vt vel ex hac collatione quanta doctrinarum omnium lux, his temporibus Dei beneficio rursus accensa sit intelligatur.

V. PRÆCEPTVM DATO ANNORVM

numero à Christo vel porro vel retrò, datus dies anni

Iuliani ad quem diem anni Aegyptij

quadret.

Sicut

Sicut vna quælibet gens, imò quilibet fere populus tum ob alias causas multas æmulationum, tum vero præcipue ob religionis & sacrorum dissimilitudinem instituit aliud initium anni, aliamque eius magnitudinem usurpauit, & intercalationem, denique menses aliter distribuit, quam vicina aliqua, Ita ex omnibus gentibus soli Aegyptij & Babylonij æquabilem annum, nempe dierum trecentorum sexagendorum ac quinquaginta & primum amplexi sunt, & postea constanter retinuerunt, Babylonij quidem, ut qui inter primos à vera Ecclesia Dei seiunctos se esse declarare voluerunt, mox ut arbitror, à diluuiio hanc æquabilem anni rationem inierunt. Aegyptij verò aliquanto post & ut existimo, ab egressu populi Israel, Nam ante illam calamitatem sanctorum patrum exemplo ipsi quoque vsi videntur esse anno Lunari quem iam inde vsque ab initio mundi ecclesia semper obseruauit, & nunc etiam in anno Iuliano quanquam solari, Paschæ lætissimam solennitatem ad Lunares Menses quoquo modo accommodamus. Porro Aegyptij ita pertinaciter anni sui formam secuti sunt ut cum sæpe à Romanis Imperatoribus defecissent, tandem à Diocletiano coacti sint præter patrum morem tot seculorum vsu confirmatum vti etiam die intercalari, & menses suos aptare Romanis mensibus, ut palam hoc etiam argumento se profiterentur subiectos esse Romano Imperio. Sicut autem hic tam æquabilis annus conuenientissimus fuit obseruationibus coelestium motuum, quibus primum Chaldaei, postea horum inuitati exemplo Aegyptij summo studio incubuerunt, ita nec æquinoctia nec solsticia stabilia esse potuerunt, sed propter defectum quadrantis diei progressa sunt in consequentia, sicut in nostro anno Iuliano paulatim anticipant, quia plus iusto intercalatur. Qua de causa cum subinde alij dies anni Iuliani quadrent ad alios dies anni Aegyptiaci, præceptum huius rei proponendum censui, tum ob alias vtilitates, quas hic recensere longum esset, tum ob lectionem Ptolomæi in qua nemo quantumlibet Geometriæ & numerorum peritus nisi simul teneat dierum Aegyptiorum iustam applicationem ad nostros dies, expedire se villo modo potest. Supra autem dixi retro ante Christum & C. Cæsarem cogitandum esse vsu anni Iuliani, ita ut omnium temporum historias ad eum referamus, propterea quod inter ciuiles annos videtur huic negotio potissimum conuenire.

Hoc igitur & sequens præceptum ut commodè tractari queat, exhibemus tibi Canonem vertendi dies anni Iuliani in dies anni Aegyptij, qui propriè quidem accommodatus est ad tres primos à natali CHRISTI, verum reliquis annis tam ante, quam post Christum in vniuersum seruire potest in hunc modum.

Solus Aegyptius annus æquabilis.

Annus Aegyptius cur minus à Diocletiano Imper.

Præceptum.

Si dati anni fuerint post Christum, diuide hunc datum numerum per 4. & excurrentem numerum interea serua. Postea datum diem nostri mensis extra in sinistro latere dicti canonis quærito, & sub eodem mense descendendo, vbi ad Angulum communem veneris, occurrentem numerum collectorum dierum excerpto. Huic iam inuento numero adiunge prius seruatum abiectis 365. si excreuerint. Collectus enim vel relictus numerus si rursus in area quærat, sub eodem titulo collectorum dierum ostendet iuxta in area sub titulo dierum mensium Aegypt. & diem & nomen mensis Aegyptij, vt libeat scire ad quem diem anni Aegyptiaci quadret 25. dies Iulij hoc anno Domini 1551. Primum hic datus numerus annorum in 4. distributus ostendit 387 vel 22. abiectis nimirum 365. Inde canonem ingressus, cum 25. Iulij inuenio sub titulo dierum collectorum dies 176. quibus additi 22. faciunt 198. Iam 198. quæsi sub eodem titulo ostendunt iuxta versus dextram 29. diem epephi Aegyptiorum, quemadmodum & in nostris Ephemeridibus annotauimus

**Exemplum
anni post
Christum.**

Quod si dati anni fuerint ante Christum, primum ab eis aufer vnitatem, eo quod proximus annus ante initium Christi fuit Bisextilis, postea reliquum numerum partire per 4. & inuentum serua, adiecta tamen prius vnitatem, & rursus abiectis 365. si redundauerint. Inde similiter ingredi cum die nostri mensis, vt dictum est, & ab inuento numero collectorum dierum aufer iam seruatum numerum. Reliquus enim in area canonis iuxta se, itidem monstrabit diem anni Aegyptiaci. Vt si quærat, quis dies anni Aegyptiaci sit 12. Nouembris anno 324. ante Christum. Abiecta vnitatem partire 323. per 4. habebis 80. & addita rursus vnitatem 81. Inde cum 12. Nouembris ingressus canonem sub titulo, collectorum dierum video dies 316. ex quibus reiecti 81. relinquunt 235. Hi denuo sub eodem titulo in area canonis iuxta se indicant primum diem Thoth mensis Aegyptij.

**Exemplum
anni ante
Christum,**

**VI. PRAECEPTVM. DATO ANNORVM N-
macro a CHRISTO vel porro vel retrò datus dies anni Aeg-
gyptij ad quem diem quadret anni Iuliani.**

Præceptum.

Rursus anni Christi diuidantur per 4. vt in præcedenti præcepto traditum est, obseruato eodem discrimine, vtrum porro vel retrò numerentur, & inuentus numerus seruetur abiectis 365. si redundauerint. Inde contraria via eundem est. Datum enim diem Mensis Aegyptij, quære in area canonis, sub titulo dierum mens. Aegypt. & numerum iuxta positum sub titulo collectorum dierum excerpto. Huic diem numero adde prius seruatum, si dati anni fuerint ante Christum, vel

vel aufer, si fuerint post. Collectus enim vel relictus dierum numerus in area inuentus ostendet extrā in sinistro margine diem, & in capite Canonis mensē nostri anni. Vt si vicissim quærat^{ur} vicesimus nonus dies Epephi Aegyptiorum, cui diei Iuliano respondeat hoc anno Do-
mini 1551. primum ex quaternaria diuisione colligo dies 387 & abiectis 365. referuo 22. Inde in area Canonis quæsi 29. dies Epephi iuxta se exhibent 198. dies collectos ab initio anni, a quibus ablatis 22. relinquunt dies 176. Hi iam in area Canonis inuenti extrā in sinistro margine monstrant 25. diem Iunij, qui scilicet mensis in capite Canonis adscriptus est.

Similiter si quærat^{ur} primus dies Thoth anno 324. ante Christum id est, primo anno ab obitu Alexandri, cui diei Iuliani conueniat, primum ex quaternaria diuisione 323. existunt 80. & adiecta vnitatem 81. Inde iuxta primum diem Thoth reperio in area Canonis dies 235. quibus adiecti 81. conficiunt 316. Hi in area rursum inuenti extrā indicant 12. Nouembris, vt supra dictum est. Initio igitur annorum ab obitu Alexandri primus dies Thoth congruebat duodecimo diei nostri Nouembris, vt retrō cogitemus etiam nunc in vsu fuisse nostrum annum Iulianum. similiter primus dies Thoth congruebat ad 26. Februarij primo anno Nabonassari, quem in sacris literis nuncupari diximus Salmanassarem.

VI. Præceptum. Datus dies in anno dato ab initio

quæ sit feria hebdomadis, quomodo CHRISTI, cognoscatur.

Ideo Deus & condidit genus humanum, & infinitam suam sapientiam, iusticiam, bonitatem, ac misericordiam certissimis argumentis, rerum creatione, ac promissione seminis patefecit, vt agnoscatur & celebretur a genere humano, non solum in hac vita, sed in omni æternitate. Quapropter Ecclesia Dei ab initio mundi usque in hunc diem seruat dierum hebdomadas institutas a primis patribus vt memoria creationis rerum, & patefactionis Dei ad omnem posteritatem progaretur. Nam primi patres ad exemplum creationis dies sex destinarunt operis rusticis & Oeconomicis, quæ necessaria sunt ad hanc vitam & hominum inter se societatem tuendam. Septimum vacare omni opere voluerunt, totumque Deo ac diuinis rebus sacrum esse, in quo fierint *παραυγας* in quibus homines de Deo, de peccato, de semine promisso, & de cæteris Ecclesiæ necessarijs dogmatis subinde erudirentur, & quantum omnino fieri posset. sanctis opinionibus ab ipsis velut incunabulis imbuerentur. Denique simul etiam Deo conditori

conditori & seruatori ecclesiæ suæ gratias vno ore agerent. & ingen-
tia beneficia, quibus quotidie Deus nos obruit, discerent considerare
in talibus congressibus. Ideo & septimus dies accepit sabbati nomen
à quiete, vt admoneamur relictis alijs rebus & studijs, quæ sunt præ-
sentis vitæ, certa tempora etiam pijs meditationibus & colloquijs de
Deo ac de futura vita tribuenda esse, & reliqui dies sex ad sabbatum
velut caput referuntur, vocantur enim prima sabbati, secunda, tertia,
quarta, quinta, sexta, vt septimo loco sabbatum velut antecedentium
consummatio accedat. Ac sequitur nunc hæc postrema ecclesia
eandem patrum consuetudinem perpetuo consensu, nisi quod iusta
de causa sabbatum impijs; ac blasphemis Iudæis verum Messiam auer-
santibus relinquit, & loco eius primam feriam celebrat quam voca-
mus dominicum diem, quod eo die Christus æterni patris filius à morte
resurrexerit, æternamq; Ecclesiæ suæ salutem auspicatus sit. Inde se-
quentes dies vocat suo ordine, secundam, tertiam, quartam, quintam,
sextam, & septimam feriam, quæ est Iudaicum sabbatum. Notæ sunt
& Astrologicæ adpellationes, vt dies \odot , M , J , S , 4 , 5 , 6 , de quarum
adpellationum ordine alibi dicitur copiosius.

*Triplex via
inueniendi
numerum
feriæ.*

Sæpe igitur fit, cum dies aliquis in anno proponitur, vt gestiat ani-
mus scire in quam feriam hebdomadis incidat. Eius quoq; rei noticia
ne sit petenda longius, triplicem viam proponimus, quarum prima
omnium est simplicissima. Referimus autem huius rei tractationem
ad initium annorum Christi, vbi collocamus 6. tanquam fundamen-
tum seu radicem, ideo quod vltimus dies Decembris antecedens hoc
initium Christi fuit sexta feria.

*1. Prima
vulgaris.*

Prima igitur via iuxta vulgares annos Iulianos ita se habet. Diuide
datum annorum plenorum numerum à Christi initio per 28. & resi-
duos annos, si qui fuerint, infer in canonem feriarum sub titulo annor-
um cycli solaris, ibiq; numerum feriarum iuxta positum excerpe, si-
militer age cum mensibus, reliquos inde dies vsq; ad eum, cuius feri-
am scire cupis diuide per 7. & huius residuum adde prioribus duob.
numeris feriarum. Deniq; hoc totum collectum adde radici, si anni
fuerint post Christum, vel aufer à radice Christi, si fuerint ante. Ita enim
vel conlabis vel relinques numerum feriæ, in quam incidit datus di-
es. Duobus exemplis lucem adferre huic præcepto conabor.

*Exemplum
primum.*

Vt libeat scire vicesimus sextus Iunij huius anni 1551. quota sit fe-
ria. Annis plenis 1550. distributis in 28. reliqui sunt anni 10. qui-
bus ingressus canonem feriarum sub titulo annorum vnus cycli sola-
ris reperio 5. ferias, Inde similiter cum Maio, vt qui proximè plenus
mensis existit, reperio 4. sub titulo anni communis post Christum. Po-
stremo

28	1
56	2
84	3
112	4
140	5
168	6
196	7
224	8
252	9

Item reliqui dies 26. diuisi in 7. relinquunt 5. iam hi 5. numeri coaceruati sunt 14. quibus additæ 6. tanquam radix annorum CHRISTI colligunt 20. Hi rursum in septenarium distributi, relinquunt 6. Ideo pronuncio 26. Iunij esse 6. feriam sicut & Calendariorum vsus monstrat.

Alterum exemplum. Volo scire 12. dies Nouembris 324. anni ante Christum quota sit feria, annos plenos 323 (abiecta nimirum unitate) diuido per 28. supersunt 15. qui sub annis Cycli Solaris quæsti exhibent 4. ferias. Inde in mensibus anni communis ante Christum December plenus dat 3. ferias, & reliqui dies 19. Nouembris, numeri scilicet retrò à fine eius vsq; ad 12. distributi per 7. largiuntur 5. ex residuo, quæ feriæ omnes coniunctæ sunt 12. & abiectis 7. (quod hic semel tantum fieri potest) relinquuntur 5. quæ tandem ablata ex radice 6. reliquam faciunt unitatem. Ideo 12. dies Nouembris fuit Dominicus, vel Iudeis prima feria sequens Sabbatum. Ex his duobus exemplis cætera in vniversum iudicabit prudens lector, quem volo tamen admonitum Calendas Ianuarij anni vltimi seu proximi ante Christum fuisse 5. feriam, eò quòd annus ille fuit bisextilis.

Sed iuxta Alphonsinam formam quomodo hoc negotium tractetur, iisdem exemplis breuiter intelligi potest. Prius igitur tempus post Christum calculo Alphonfino accommodatum suppeditabit duas sexagenas tertias, 37. sexagenas secundas, 18. sexagenas primas dierum, tum verò dies 34. annumerato videlicet 26. die Iunij, de quo est quæstio, tametsi in motibus non nisi plenos dies sumere oportet. Primum ergo ex Canone feriarum 2. sexagenæ sub titulo tertiarum præbent 2 ferias, inde 37. sex. sub titulo secundarum dant 4. inde 18. sexa. sub titulo primarum præbent 2. ferias, & tandem 34. indicant 6. qui quattuor numeri colligunt dies 14. & addita radice 6. euadunt in summa 20. Cætera perage vt prius. Similiter posterius tempus Alphonfino abaco aptatum sic se habet 32. sexagenæ secundæ 47. sexagenæ 1^æ. 5. dies, quibus ordinè respondent feriæ 1. 6. 5. id est in summa 12. Cætera vt prius.

Postremò si anni Iuliani fuerint abs te conuersi in Aegyptios, quomodo etiam absq; vllius Canonis adminiculo negotium hoc tractetur, iisdem exemplis discite. In priori exemplo sunt à Christo ad nos anni Aegyptij pleni 1551. diesq; 199. annumerato rursus ipso vicessimo sexto die Iunij, in quo omnis quæstio nunc versatur. Iam anni 1551. distributi in septenarium relinquunt 4. ferias: singulis enim annis respondent singulæ feriæ. Similiter dies 199. distributi relinquunt ferias 3. quæ simul cum radice 6. sunt feriæ 13. (quod hic semel tantum

Alterum.

2. Alphonfina forma.

3. Tertia forma ex annis Aegyptijs.

fieri potest) reliquæ ostendunt 26. diem Iunij esse 6. feriam. Similiter in posteriori tempore à Christo versus initium mundi distributis plenius annis Aegyptijs 323. in 7. relinquatur vna feria, diebus verò 130. relinquuntur 4. feriae, quæ pariter sunt 5. feriae, ablataeq; ex radice 6. relinquunt vnam feriam ad diem 12. Nouembris anno 324. ante Christum. quod antè diximus esse initium annorum ab obitu Alexandri.

Hactenus etiam de temporum ratione præcepta tradidi, quæ nostro instituto sufficiunt. Nunc ad motus ipsos reuertor. in quibus primum ratio computandi medios seu æquales motus tradenda est.

VIII. PRAECEPTVM DE CALCULO MEDIORUM seu æqualium motuum

*Scopus astro-
nomicarum
tabularum.*

Sæpe iam dictum est, hunc scopum esse omnium Astronomicorum canonum seu tabularum, vt citra vllam obseruationis molestiam stellarum motus vel adparentia in cælo loca numerorum peritis verissimè & quàm expeditissimè exhibeant, quodcumq; tempus proponatur siue præsens. siue fututum, aut etiam quod multis seculis ante præterierit. Sed cum adparentes motus sint admodum dissimiles & inter se inæquales, inuēti sunt magna solertia & labore artificum primū æquales motus, qui æqualibus temporibus aptè congruunt: accedunt deinde Canones Prosthaphæreseon, qui monstrant, quid æqualibus motibus seu locis, in quauis circuli parte addendum sit, demendumue, vt noticiam verorum motuum adipiscamur. Iam ad ipsos æquales motus colligendos ex Canonibus opus est imprimis epocha, quæ nihil aliud est, quàm initium motus congruentis certo tempori, vnde æquales motus deriuamus ad alia tempora vel sequentia, vel etiam antecedentia.

*Triplex via
colligendi
æquales mo-
tus.*

Suprà autem docui datum tempus ad vsum calculi æqualium motuum accommodare. Nunc ergo triplex forma colligendi hos æquales motus monstranda est breuiter. Ac vulgari tempori seruiant primi Canones mediorum seu æqualium motuum, qui ordinè respondent annis primū collectis, postea simplicibus, deinde mensibus, deinde diebus, postremò horis, & earum scrupulis. Et quia hic ordo Canonum per se satis præceptum huiusce calculi explicare videtur, vtor tantum exemplo, in quo videt lector concinnam temporis transacti distributionem abhibendam esse. Sint ergo à CHRISTO completi anni 1489. menses 4. dies 16. horæ 10 scrupula vnus 56. Libet inquirere æqualem motum Solis simplicem, qui videlicet æquabiliter numeratur à Prima stella Asterismi Arietis. Iam quia hoc tempus ab

initio

*I. ratio vul-
garis,*

initio Christi pendet, excerpto ante omnia epochen Christi. cui motus omnes sequentis temporis adiungendi sunt. Ea autem epoche est 4. sexag. 32. part. 29^{1^a}, 51^{2^a}. Hinc annis 1400 in sinistro margine congruat sub titulo simplicis motus Solis 5. sexag. 50. part. 45^{1^a}, 11^{2^a}, inde annis 80 in eadem pagina 5. sexag. 59. part. 28^{1^a}, 19^{2^a}. Inde annis 9. simplicibus sub eodem titulo 5. sexag. 59. part. 41^{1^a}, 39^{2^a}. Inde 4. mensibus scilicet ad finem Aprilis 1. Tex. 58. part. 16^{1^a}, 23^{2^a}, ut in anno communi. Inde diebus 16. congruunt 15. part. 46^{1^a}, 11^{2^a}. Inde 10. horis 0. pars. 24^{1^a}, 38^{2^a}. Inde 30. scrup. horæ vnus 1^{1^a}, 14^{2^a}, ferè, & rursum 26. horæ scrupulis 1^{1^a}, 42^{2^a}. Canon enim scrupulorum horæ definit in 30. Ideo ad hunc modum duplici vtendum est introitu, quoties plura quàm 30. scrupula horæ vnus proponuntur. Iam hæc omnia in vnâ summam ordinè coaceruata abiectis integris circulis, vt supra dictum est, offerunt æqualem motum ☉ simplicem dato tempori congruentem, 0. sexag. 36. part. 54^{1^a}, 29^{2^a}, quemadmodum hic subiecinus.

Aequalis motus 0 36 54 29 quæsitus

Hoc igitur modo cæteros æquales motus in vniuersum omnes colligendos esse memento, ne eadem cantilena odiosè sit repetenda.

Quod si voles colligere æquales motus. ad tempus quoddam epochen tuam antecedens, totius continui temporis retrò numerati motus in vnâ summam coniecti auferendi sunt ab epoche, Cuius rei exemplum supra in subtractione tibi exhibuimus.

Sed Alphonsinam formam in colligendis medijs motibus nonnulli 2. Ratio Al. magis probant. quòd & vnico canone vbiq; sit contenta, & plerunq; *phonfinorum.* paucioribus ingressib. expediamur. Discas & hanc prorsus ex hoc vno exemplo. Tempus natalitium inclyti Ducis Borussix huic calculo aptatum ita se habet 2. tertix. 31. secundæ. 6. primæ sexag. dierum, ac dies præterea 33 27^{1^a}, 20^{2^a}. Canones autem æqualium motuum huic & sequenti formæ convenientes antecedunt singuli suarum Prosthaph.

canones, in quibus primus est præcessionis æquinoctiorum. inde Solis
Lunæ, Saturni, Iouis, Martis, Veneris, atq; Mercurij.

Ad datum igitur tempus eundem æqualem motum \odot simplicem
sic colligito. Epoche Christi primo loco scribatur sicut prius. Inde
2. sexagenis tertijs dierum congruunt 4. sexagenæ 22. part. 44 ^{1^a},
32 2^a, 22 3^a, sub titulo tertiarum sexagenarum dierum, nam antece-
dentes numeros tanquam integros circulos præterimus, quemadmo-
dum etiam ex 16. sexagenis partium abieciimus 12. velut 2, circulos,
vt reliquæ fierent illæ 4. sexagenæ, hoc compendio mox inter excer-
pendum vtaris, quoties vsus exigit, inde 31. sub titulo sexagenarum
secundarum congruunt 3. sex. 13. part. 52 1^a, 30 2^a, 22 3^a, ferè, abie-
ctis rursus 30, sexagenis, velut 5. circulis Inde 6. sub titulo prima-
rum sexagenarum dierum congruunt, 5. sexag. 54. part. 49 1^a, 8 2^a,
14 3^a, ferè, Inde 33. sub titulo dierum 0. sexag. 32. part. 31 1^a, 30 2^a,
15 3^a. Atq; hæc tituli in capite canonis inspiciendi erant. Nunc
ijdem indices imas partes possident. Nam 27. scrupulis primis vnus
diei congruunt 0 grad. 26 1^a, 36 2^a, 41 3^a, item 20 scrupulis secundis
0 1^a, 19 2^a, 43 3^a, ferè. Vides igitur quæ in hac Alphonsina forma
præcipuè obseruanda sint, nempe tituli, & initia eorum numerorum
qui excerpuntur. Nam dum per tertias sexagenas dierum canonem
ingredimur, tres primos locos in motibus tanquam supernumera-
rios præterimus, per secundas verò sexagenas duos tantum primos,
deniq; per primas vnicum saltem primum. In diebus autem singulis
nullus prætermittitur locus. Rursus in scrupulis dierum primis, lo-
cus primus canonis est grad. seu partium, in secundis verò idem locus
est scrupulorum primorum, & sic deinceps congruenter. Iam hæc o-
mnia coagmentata decenter exhibent æqualem motum, vt prius 0.
sexag. 36. part. 54 1^a, 29 2^a, Satis est enim vsq; ad secunda scrupula
partis progredi in calculo motuum, sed ne quid desiderari possit sin-
gula rursus suo ordine subieciimus.

Æqualis motus quæsitus	0	36	54	29	10

Ita Alphonsina forma quia totum tempus intermedium aptissime
refert

refert ad vnam dierum speciem, per sexagenas & scrupula eorum, contenta est in singulis æqualibus motibus similiter vnico canone quem semper dextra pagina offert. At sequens Copernici forma, etiam vbiq; ^{3^a ratio Co-} ^{pernici.} sinistrum canonem sibi adsciscit propter annos Aegyptios & eorum sexagenas, vt in eodem exemplo tempus iuxta eius formam sic habet 24. sexagenæ annorum, 49. anni Aegyptij 8. sexagenæ dierum, diēsque 28. 27 1^a, 20 2^a. Ad hoc tempus rursum colligatur æqualis motus ☉ simplex, primum in sinistra parte ad 24. sexagenas annorum offerunt se 5. sexag. 55. part. 0^a, 11 2^a, 23 3^a. Nam primus locus rursus tantum supernumerarius relinquitur, & de 53. secundo loco abijciuntur 48. velut 8. circuli. Inde 49. annis congruunt 6. sexag. 47. part. 36 1^a 9 2^a, 35 3^a. Postea in dextra pagina 8. sexagenis dierum congruunt 1. sexag. 53. part. 5 1^a, 30 2^a, 58 3^a. Primus enim locus prætermittitur, & in secundo de 7. abijciuntur statim sex velut integer circulus. Inde 18. diebus congruunt 27. partes 35 1^a, 42 2^a, 18 3^a, & 27. scrup. primis 26 1^a, 36 2^a, 41 3^a, & 20. secundis 19 2^a, 43 3^a. Quæ similiter vnā cum Epocha collecta in vnam summam efficiunt 0. sex. 36. part. 54 1^a, 29 2^a, 9 3^a. Verum in secundis scrupulis partim citra vllam calculi iacturam resistimus. Ecce rursus

simplex proposito temporis congruens.

Hactenus ergo triplicem formam colligendorum æqualium motuum monstraui, etsi studiosus lector, qui primum huic calculo manus admouet, vtilius sese ad vnam tantum formam adfuecit, ne animus eius hac varietate distractus facile erroribus implicetur. Deinceps ergo de veris motibus differendum erit, quibus cum deseruiant canones prosthaphæreseon, horum descriptio prius tradenda est, vt & partes & tituli eorum cogniti vsum reddant faciliorem.

XL. PRAECEPTVM DE PARTIBVS TITVLIS,

& usu canonum Prosthaphæreseon.

Omnes canones Prosthaphæreseon motum æqualium in longitudinem

G 3

De semicirculo.

finem extendunt se vsq; ad semicirculum. ideo quòd in duob, certis punctis circuli ex diametro oppositis, apogeo scilicet & perigeo, nullum existat discrimen æqualis & adparentis motus, sed tota varietas perpetua serie eodẽmq; modo in viroq; semicirculo conficiatur, ita videlicet, vt & circa media ferè puncta maxima fiat prosthaphæresis, & bina loca vtriusq; semicirculi ab alterutro illorum certorum punctorum æqualiter distantia habeant ipsas prosthaphæreses magnitudine æquales, sed qualitate dissimiles. Eadem enim æquatio in altero semicirculo additur, in altero autem subtrahitur æqualibus motibus quemadmodum hoc discrimen ipsis titulis, indicatur: Et in elementis ac hypothesibus Astronomiæ, causas huius varietatis eruditè monstrant artifices.

*Sexagena
plena intelli-
gantur item
q. alia.*

Hinc in singulis canonibus supremi quidam tituli vel indices à nulla parte progrediuntur in 180. partes, vel ab 0. sexagena in 3. sexagenas plenas, at infimi indices à 180 partib. ad 360. vel à 3. plenis sexagenis ad 6. plenas. quæ absoluunt totum circulum. Ac sexagena quidem ipsæ sic notatæ semper plenæ intelligantur. Singularum verò sexagenarum seu gradus seu partes (nam his appellationib. promiscuè utimur) in margine tam sinistro quam dextro adscripti sunt, hac lege, vt cum datas sexagenas plenas offert caput canonis, gradus reliqui adiacentes ipsis sexagenis in descensu sinistri marginis quæri debeant, in ascensu autem dextri marginis, quando inum canonis habet datas sexagenas.

Differentiæ,

Iam ipsa area cuiusq; canonis continet prosthaphæreses, quib. singulis suæ adiectæ sunt differentiæ à gradu in gradum. Ac in differentiis quidem A. titulus est index additionis. S. verò subtractionis, pro vt equationes ipsæ vel crescunt vel decrescunt vnde etiam alicubi occurrentes paragraphi ostendunt loca vicissitudinum, in quibus fit transitus ab additione in subtractionem, vel è contra. Proinde cum ambæ literæ A. & S. occurrunt in eodem ordine alicuius paginæ, prima. vt in capite canonis superior in calce autem inferior, valet vsq; ad paragraphum. inde reliqua litera ad finem eius ordinis siue ascendas siue descendas. Hæc sunt quidem puerilia, sed iuuare discentium studia conamur.

*Canon octauæ
sphæræ.*

Errantium.

Primus canon prosthaphæreseon octauæ sphæræ duas habet partes seu ordines, videlicet æquationem præcessionis æquinoctiorum, & æquationem obliquitatis signiferi, vel declinationis ☉. maximæ. Reliqui canones stellarum 7. errantium singuli habent ordines quadruplices, quibus rursus singuli ordines differentiarum adiacent, vt sint in summa particulares ordines 8. Quilibet enim planeta principaliter geminam desiderat æquationem, quarum alteram generaliter vocemus centri, alteram orbis, Iam ipsa orbis æquatio quia ad alterum extremum locum sui circuli vel proximum vel remotissimum computata est

ra est, adsciscit & alium ordinem titulo excessus. Et rursum ut numeri huius adscitici ordinis congruenter ad usum queant transferri, accedit ipsi æquationi, quam centri diximus, adhuc alius ordo, nempe *Excessus & scrupula proportionalia.* scrupulorum proportionalium. Itaq; hi duo ordines, qui sunt appendices duorum principalium, excessus, inquam, & scrupula proportionalia omnino se habent correlatiue, ut alterum ex altero pendeat. Nam si alterum eorum nihil fuerit, reliqui etiam nullus usus est, sed si utrumq; est aliquid, pars proportionalis seu congruens scrupulis proportionalibus de excessu colligitur, quæ in omnibus planetis perpetuo citra ullam exceptionem ad o. b. s. æquationem adiungitur. Etsi autem de parte proportionali supra in logistice dictum est, tamen ubi opus erit, nonnulla discendum gratia repetemus.

Postremo quoties ingrederis aliquem horum Canonum vel cum integris sexagenis, vel cum sexagenis & integris partibus, ita ut nulla supersint scrupula, ritè excerpta æquatio in angulari profelide, seu communi angulo per se iusta est, nec aliam desiderat correctionem, sed si qua scrupula partibus adhæserint, adhibenda est correctio, ita ut de differentia pars proportionalis seu congruens illis scrupulis inuenta æquationi vel addatur, vel subtrahatur, prout æquatio crescit vel decrescit, quemadmodum dictum est.

Ceterum de appellationibus quia alio loco dictum est, ero hic breuior. Quod recentiores vocant æquationem, id Ptolom. eruditè vocat *πρόσφασις*, quæ dictio Græca est, & ex duabus alijs, quæ Arithmeticæ artis propriæ sunt, concinnè componitur, quarum altera *πρό* *προ* additio Latinis est, altera *φάσις* subtractio. Est enim hæc natura Prosthaphereoseos, ut aliàs addatur aliàs dematur equal. motib.

Appellatione scrupul. utimur, ut alij minutorum pro particulis sexagesimis alicuius integri. Scrupula autem quæ vocantur proportionalia in omniibus planetis sunt vniuersi, nempe in apogeo Eccentri nulla in perigeo 60, quod Ptolom. in sola Δ . obseruauit. Nos in hac quoq; parte Coper. viam secuti Prosthaphereoseos orbis tantum ad Eccentri apogeon & perigeon supputauimus, ad proportionum scrupula accurata diligentia venati sumus. Quare in nostris cano. scr. proportio num simplicia sunt, nec in longiora & propria discernuntur, quæ varietas magis turbat calculum quàm promouet. Quod alij diuersitatem diametri, nos simpliciter excessum vocamus, quia cum æquationes orbis scriptæ in nostris canonib. sint cõputatæ ad apogeon eccentri, ubi singulæ existunt omniū minimæ: his præterea adiectæ sint suæ differentiæ, quib. perigeæ æquationes superant apogæas, manifestum est huic ordini differentiarum æquationis vtriusq; apogei & perigei, rectè attributam esse adpella.

adpellationem excessus. At Alphonsini, vt duplicia habent Ptolemai imitatione minuta proportionalia, ita & duplicem diametri diuersitatem, longiorem, siue defectum, & propiorem, siue excessum, quia equationes in ipsorum Canonibus scriptæ ad longitudinem Eccentri mediam supputatæ sunt. Verum hanc varietatem ex motuum calculo remouendam censuit summus vir Copernicus

Initium Calculi ab 8. Sphæra.

Hactenus ergò de medijs motibus abundè dictum est, & paratus aditus ad Calculum adparentium motuum. Deinceps singuli adparentes motus ordinè explicandi erunt. Ordinemur autem ab Octaua Sphæra, tum ob alias causas. tum quia adparentes motus referri solent ad verà æquinoctia. Proximos enim triginta gradus æquinoctio verno attribuimus dodecatemorio Arietis, inde proximos 30. dodecatemorio ♄. & sic consequenter.

DE MOTIBVS ADPARENTIBVS X. PRAECEPTUM. De veræ præcessionis æquinoctij verni supputatione.

Quantum distet prima stella Asterismi Arietis ab adparente æquinoctio. επιλογισµὸς πρώτης ἀστὴρος τοῦ αἰετός.

Prudenter Copernicus omnes motus Cœlestes numerat à prima stella Asterismi ♈. velut à certo & fixo principio quòd in ipsos etiam oculos incurrat, Quem vt in cæteris ferè vbiq;, ita in hac parte sequi visum est. Ideo & præcessionis æquinoctiorum æqualem motum vocat, quo fit, vt æqualibus temporibus per æqualia inuicem interualla recedant locus mediæ æquinoctij, & prima illa stella ♈. Verà autem præcessionem, cum per datum aliquod tempus eadem prima stella ♈. & locus adparentis æquinoctij certo interuallo inuicem distinguuntur. Quare arcus Zodiaci comprehensus inter duos circulos maximos, quorum vterq; per eiusdem Zodiaci polos describitur, sed alter horum simul per primam Arietis stellam, erit æqualis motus præcessionis, si reliquus eorum per locum mediæ æquinoctij: verus autem motus præcessionis, si idem reliquus per locum adparentis æquinoctij describitur. Differentia autem inter medium & apparens æquinoctium est Prosthaphæresis seu æquatio æquinoctiorum, quæ maxima scrupulorum est 71 1^a & secundorum 22. cum semisse vnius secundi.

Calculus ergò veræ præcessionis fit in hunc modum. Ad datum tempus collige ex canone æqualium motuum tam æqualem præcessionis, quàm anomalie simplicis iuxta doctrinam octauæ præcepti. Voco autem datum tempus, cuius non solum magnitudo, sed principium simul ac finis datur. Nam motus omnes ab aliqua epocha siue certo principio deriuare oportet. Per duplicatam vero anomaliam ingressus Canonem Prosthaphæreseon æquinoctiorum excerpe eandem Prosta-

Ep. Sph. 8a

Prosthaphæresin, ac emenda eam per partem proportionalem, si opus est, ut & antè dixi, & mox exemplo monstrabo. Ita verò emendatam æquationem subtrahere, si duplicata anomalia minor extiterit semicirculo, vel adde æquali motui, si maior. Sic enim conflabis veram præcessionem verni æquinoctij. Et si autem tituli ipsi indicium faciunt additionis & subtractionis, tamen in singulis præceptis verorum motuum ea de re monebo lectorem, ut si negligentia quadam depraventur tituli, hinc corrigi queant.

Verum ut exemplo præceptum hoc illustretur, sit datum tempus Natalicium inclyti D V C I S Borussiæ, quod deinceps semper utemur, nisi expressè aliud nominemus, Completi autem sunt ab initio annorum Christi anni 1489 menses 4 dies 16 horæ 10 cum scr. 56. tamen si in hoc calculo, citra vllum detrimentum non horas tantum cum scr. verum ipsos dies etiam præterires. Aequalis ergò motus præcessionis colligitur 0. sexa. 26. part. 19 1^a. 23 2^a, 58 3^a, Anomaliæ verò 2. sexa. 42. par. 55 1^a, 52^a, 26 2^a, quæ duplicata fit 5. sex. 25. par. 50 1^a, 11 2^a, iam in Canone Prosthaphæreseon 5. sexa. non in capite, sed calce eius reperio. Quæro ergo 25. gr. in ascensu marginis dextræ, qui gradus nunc sanè in dextra pagina se offerunt. In angulari itaq; proselide sub titulo præcessionis æquinoctiorum occurrit æquatio 40 1^a, 56 2^a, 20 3^a, cum differentia 1 1^a, 12^a, 36 3^a. scilicet ascendendo, cuius differe, rentræ titulus est S. eò quòd æquatio ipsa decrescit. Hinc pars proportionalis quærenda est. Quia enim intervallo vnus gradus decrescit æquatio vno scr. primo 1 2^a, 36 3^a, explorandum est, quantum decrescat 50. scr. primis, & 11. secundis vnus gradus. Vides hoc exemplum quadrare ad priorem casum de parte proportionali, quia lateralem ingressum fecimus, ut sola multiplicatione proferatur pars congruens, Multiplicata ergo differentia 1 1^a, 12^a, 36 3^a, per 50 1^a, 11 2^a, existunt 51 2^a, 31 3^a, 17 4^a, 56 5^a. Verum abiectis quartis & quintis sola secunda & tertia retineantur. Pars ergo proportionalis congruens scr. 50 1^a, 11 2^a, est, 51 2^a, 31 3^a, demenda ex æquatione 40 1^a, 56 2^a, 20 3^a, eritq; emendata æquatio 40 1^a, 4 2^a. 49 3^a, adiicienda æquali motui præcessionis. Ideo vera præcessio verni æquinoctij, id est, vera distantia adparentis æquinoctij à prima stella ♀, est 26. part. 59 1^a, 28 2^a, 47 3^a, ad datum tempus natalicium inclyti Ducis Borussæ.

Iam illud notius est, quàm ut verbis egeat, solstitia itemq; æquinoctia inuicem semicircularum intervallis distare, ab æquinoctijs verò solstitia ipsa intervallis quadrantum. Quare inuenta distantia verni æquinoctij à prima stella ♀, quantum alterum æquinoctium & duo solstitia ab eadem stella absint, quisq; suo Marte ratiocinabitur.

πρὸ τῶν ἀστ
ἐων ἅπλ
ως,

XI. PRAECEPTVM DE VERIS LOCIS STELLARUM fixarum seu inerrantium ab adparenti æquinoctio.

Iam stellæ fixæ in qua parte cuiusq; dodecatemorij ab apparente æquinoctio versentur, facile est pronunciare. Infra enim in Canonica expositione stellarum inerrantium loca earum secundum longitudinem à prima stellâ asterismi Arietis numeravimus. Singulis igitur ipsarum numeris eiusmodi adiungito veram æquinoctij verni præcessionem, quæ iuxta præcedens præceptum ad datum quodvis tempus inuenitur. Mox enim colliges distantiam stellæ ab apparenti æquinoctio in partib: 360. circuli. quas si per triacada coagmentaueris, adparebit in quo dodecatemorio & in qua parte eius stellâ versetur. Vt si quæretur verus locus Basilisci, quæ est stellâ in corde Ω ab adparenti æquinoctio nempe ad datum tempus inclyti Ducis Borussiae, inuenta est vera præcessio per antecessens præceptum part. 26. 59 1^a , 29 2^a . Longitudo autem eius stellæ à prima in capite Υ . est partium 115. 50 1^a , quibus adiecta vera præcessio conficit partes 142. 49 1^a , 29 2^a , fere. Distat ergo basiliscus ab adparenti æquinoctio partibus 142. 49 1^a , 29 2^a , id est, quatuor dodecatemorij 2. gr. 49 1^a , 29 2^a , vel est in 22. gr. 49 1^a , 29 2^a , Ω . Similiter longitudo seu distantia spicæ Υ . à prima stellâ Υ . est partium 170 quibus addita vera præcessio ostendit distantiam eiusdem spicæ ab adparenti æquinoctio par. 196. 59 1^a , 29 2^a , id est, spica versabatur in 16. gr. 59 1^a , 29 2^a , dodecatemorij $\frac{1}{2}$ ad natalitium tempus inclyti Ducis Borussiae.

Cæterum in Canonica descriptione stellarum inerrantium præstitimus tantum, quantum hoc quidem tempore potuimus. Sed cum observationes eruditæ testentur, loca earum tam in longum quam in latum, sepe perperam notata esse. variantibus etiam tot exemplaribus, siue id solum librariorum culpa acciderit, siue verò nonnulla etiam artificum negligentia. qui hætenus rari existerunt multis seculis. vel ob eam causam, quia optimæ artes regum ac principum liberalitate non admodum fouenter, danda est nunc omnibus, qui multi in hæc studia præclare incumbunt. opera, ut stellarum loca exquisitiùs capiantur, ac emendentur errata. Mei quidem ouij, in quo hætenus versatus esse videor ratio constabit ex nostris lucubrationibus, si in lucem proferrantur. Deinceps verò hanc quoq; Astronomicæ doctrinæ partem pro virili adiuuare & excolere conabor. Id si à pluribus simul fiet ea, quæ decet studiorum contentione, (cum vnius hominis observatio parum sit ad summam rei, & collatione artes omnes & constitutæ sint, & illustratæ) tum demum, Deo gubernante, foeliciter hoc opus procedet.

XII. PRAECEPTVM, QVANTO IN DATO TEMPO

reut dato aliquo annorum numero adparens æquinocti-
um recedat à prima stella Aſterifmi V.

Quære veram præceſſionem verni æquinoctij tum ad initium, tum
ac finem dati temporis per 10. præceptum. Hinc ab inuentarum præceſ-
ſionum posteriore, quæ ſemper maior eſt, auſſer priorem, Reliquus enim
arcus oſtendit vel reſreſſum adparentis æquinoctij à prima ſtella V.
vel, ſi mauis progreſſum eiſdem ſtellæ ab ipſo vero æquinoctio per
datum illud temporis interuallum. Vt ad datum tempus natalicium
inſlyti Ducis Boruſſiæ inuenta eſt vera præceſſio par. 26. 59 1^a, 29 2^a,
ſi libet iam ſcire quantum adparens æquinoctium annis 61. plenis poſt
loco moueatur, quæſio ſimiliter præceſſionem veram æquinoctij ex-
actis à Chriſto annis 1510. menſibus quatuor, Dies enim & horas in
hoc calculo citra illam ſacturam neglexeris, vt ante dictum eſt. Hac
autem poſterioris temporis præceſſio colligitur par. 27. 36 1^a, 28 2^a,
32. à qua prior ſubtracta relinquit par. 0. 36 1^a, 59 2^a, 32. Annis ergo
61. plenis poſt natalicium tempus inſlyti Ducis Boruſſiæ adparens
æquinoctium loco motum eſt per ſcrup. 36 1^a, 59 2^a, 32. vnus par-
tis ſeu gradus Eclipticæ.

XIII. PRAECEPTVM, DE CALCULO MAXIMÆ OB-
liquitatis Solis quouis dato tempore.

Duplicem formam tibi monſtrabimus. alteram Copernici ſummi $\pi\phi\sigma\tau\eta\epsilon\lambda\phi$
artificis, alteram noſtram. Copernici ſic habet. Ad datum tempus col-
lige anomaliam ſimplicem æquinoctiorum ſeu obliquitatis ex canone $\epsilon\omega\sigma\tau\epsilon\omega\epsilon\tau\delta$
motuum æqualium, ac per eam ex canone Proſtha æquinoctiorum
& obliquitatis Zodiaci excerpe ſcrupula conuenientia ſub titulo ſcrup-
ulorum, per quæ de 24. ſcrupulis primis venare partem congruen-
tem ſeu proportionalem, quæ ſemper minimæ Solis obliquitati ſeu
declinationi addenda eſt, videlicet partibus 21. 28 1^a. Eſt enim iuxta
obſeruata & Copernici hypotheſes Solis obliquitas omnium maxi-
ma Part. 23. 52 1^a, minima verò par. 23. 28 1^a, vt differentia vtriuſq;
ſit 24. ſcrupulorum primorum, & media iater has extremas obliqui-
tas par. 23. 40 1^a. Ita maximam ☉. declinationem indagaueris iuxta
Copernici formam, quam ideo primum recitaui, quia illa ſcri. quibus
medijs inueſtigatur pars proportionalis addenda, in alijs etiam non
paucis ſupputationibus primi mobilis gratum uſum habent, vt ſuo lo-
co dicemus. Exempli gratia. Ad noſtrum tempus anomalia obliquita-
tis inuenta eſt iuxta octauum Præcep. 2. ſex. 42. par. 55 1^a, 6 2^a, quibus
in Canone Proſtha. obliquitatis zodiaci reſpondent ſcrupula 1. 1^a, 19
2^a, 44 3^a. His autem ruruſum de 24. ſcrupulis primis congruunt 31 2^a,
H 2 52 3^a.

52 3^a, quæ adiuncta minimæ obliquitati constituunt eam partium 23.
28 1^a, 3 2^a, 52 3^a. Tanta fuit maxima ☉. obliquitas eo tempore, quo
inclutus Borussiae Dux in hanc lucem æditus est. Aliud exemplum,
initio annorum Domini fuit simplex illa anomalia sexag. 0. part 6.
40 1^a, 27 2^a, per quæ dantur ex canone scrupula 59 1^a, 48 2^a. His iam
de 24. scrupulis primis, videlicet de differentia maximæ, & minimæ
obliquitatis ☉ congruunt 23 1^a, 55 2^a, 12 3^a, quæ adiecta minimæ obli-
quitati veram constituunt, part. 23. 51 1^a, 55 2^a, 12 3^a.

ALTERA RATIO: ingredi cum anomalia Obliquitatis eundem
canonem Prosthaphæreseon & sub titulo obliquitatis zodiaci excer-
pe æquationem addendam obliquitati Solis mediæ, dum anomalia
minor est quadrante circuli, vel maior dodrante, auferendam verò,
dum maior quadrante minor tamen dodrante fuerit, vt si primum
exemplum reperatur, anomalia duarum sexag. 42. part. 55 1^a, 6 2^a,
dat æquationem 41 1^a, 28 2^a, 4 3^a, auferendam à media obliquitate
part. 23. 40 1^a, Relinquitur ergo Solis obliquitas, quæ maxima fuit
illo tempore, natalicio inclyti Ducis, par. 23. 28 1^a, 32 2^a, 46 3^a. Vi-
des quàm propè inter se congruat vterq; calculus, vt vix paucula tertia
vnius gradus intercedant.

XIIII. PRAECEPTVM. IN DATO ALIQUO TEMPO- re quantum præcessio æqualis & adparens verni æquinoctij inter se distent.

Vt priùs inuenias per præcedentia, tam æqualem quàm veram
præcessionem, verni æquinoctij ad initium & finem dati temporis,
aufer similia à similibus, priora à posterioribus, vt æqualem præces-
sionem ab æquali, veram à vera. Reliquæ differentiae monstrant id
quod quaeritur, vt in eodem nostro exemplo, anno scilicet 1490. men-
se Maio fuit æqualis præcessio part. 26. 19 1^a, 24 2^a, vera autem part.
26. 59 1^a, 29 2^a, Rursùm annis 61. plenis post æqualis quidem præ-
cessio part. 27. 10 1^a, 28 2^a, sed vera part. 27. 56 1^a, 28 2^a, Differentia
æqualium præcessionum est part. 0. 51 1^a, 4 2^a, verarum autem est
scrupulorum 36 1^a, 59 2^a. Ideo scrupulis 14 1^a, 5 2^a, minor est diffe-
rentia verarum præcessionum quàm æqualium in datis annis 61. me-
dijs. Est autem & vtriusq; temporis earundem Prosthaphæreseon de-
crescentium differentia totidem scrupulorum, scilicet 14 1^a, 5 2^a.
Quod sagaci lectori indicasse satis est.

Nunc accedimus ad calculum motus ☉ vel $\tau\eta\phi\omega\phi\omega\zeta\iota\alpha\nu\ \eta\lambda\iota\alpha\kappa\lambda\omega$,
vt Græci vocant, in qua & de anni apparenti magnitudine docendus
erit studiosus calculator.

XV. PRAECEPTVM. DE CALCULO VERI siue adparentis motus Solis.

Initio

Initio vocabula, quibus utimur in his nostris canonibus explicare DE SOLE.
conuenit. etsi hoc alibi factum est copiosius. Motus ☉. simplex æqua-
lis vocatur, qui æquabiliter penderet à prima stella asterismi V. Motus
verò Solis compositus, æqualis, qui regulariter penderet ab æquinoctio
medio: vocatur enim compositus, quia simplici motui Solis tantum
addit, quanta interea æqualis est facta præcessio æquinoctij. Motus de-
niq; anomalix ☉. penderet æquabiliter ab apogeo medio. Hæ descri-
ptiones semper sint in conspectu in annui calculo motus Solis: unde e-
tiam adparet duplici ratione motum Solis ad calculum vocari posse.

PRIOR. Ad datum tempus ex superioribus sit primum inuenta
vera præcessio verni æquinoctij, cum anomalia simplici æquinoctiorum:
deinde similiter æqualis motus ☉. simplex cum annua anomalia ☉. æ-
quali. Hæc quatuor, ubi in promptu fuerint, inde in canone Prosthaphæ-
reseon ☉. per anomaliam simplicem æquinoctiorum excerpe æquationem
centri suo loco cum scrupulis proportionalibus. adhibita iusta correctio-
ne, si gradibus adhæserint aliqua scrupula. Est autem hæc centri æquatio dif-
ferentia inter utrumq; apogeon medium & verum, quæ ut ante semicir-
culum additur, ita post subtrahitur, ad efficiendam coæquatam ano-
maliam annuam. Seruentur autem interea scrupula proportionalia,
At cum hac coæquata anomalia rursus ingressus eundem canonem
elicit Prosthaphæresin annui orbis suo loco, cum sequenti excessu,
ac memento semper adhibendam esse correctionem, si anomalia præ-
ter gradus constet etiam scrupulis vnius gradus. Porro de hoc exce-
ssu sumes partem proportionalem seu congruentem scrupulis propor-
tionalibus, quæ proximè adseruata sunt. Hæc quidem pars congruens
semper adijcienda est Prosthaphæresi annui orbis, ut fiat Prosthaphæ-
resis ipsa æquata seu absoluta. Iam hæc ipsa quoq; ablata ex æquali
motu Solis, si anomalia coæquata fuerit minor semicirculo, vel addi-
ta, si maior, conficit adparentem motum ☉. à prima stella V. cui mo-
tui si tandem adiungas veram præcessionem æquinoctij, abiecto in-
tegro circulo si redundauerit, adparebit in qua parte cuius dodecatemo-
rij Sol ab ipso vero æquinoctio versetur.

Exemplum. Ad datum tempus Illustriss. Ducis Borussix inuenta
est per præcedentia æquinoctij vera præcessio part. 26. 59. 1^a, 29 2^a,
Et simplex anomalia sex. 2. part. 42. 55. 1^a, 6 2^a. Deinde motus ☉. sim-
plex æqualis sexag. 5. part. 36. 54. 1^a, 29 2^a, & annua anomalia æqualis
sexag. 5. part. 25. 28. 1^a, 56 2^a. Iam per simplicem anomaliam primam
ex canone Prosthaphæreseon ☉. colligitur æquatio centri partium 2.
28 1^a, 5 2^a, addenda, & scrupula proportionalia, 1 1^a, 31 2^a, adser-
uanda interim. Euadit ergo coæquata anomalia sex 5. part. 27 57 1^a,
H 3 1 2^a,

DE SOLE.

ἐπιλογισ-

μὲς ἡμεροφω-

ρίαις ἡλιακῆς.

Mota solis cum

p. p. h. s.

12^a. Quæ rursum ex canone suppeditat æquationem orbis partis 0. 57 1^a. 10 2^a. & excessum sequentem scrup. 16 1^a. 18 2^a. de quo scrupulis proportionalibus asseruatis 1 1^a. 3 1 2^a. congruunt scrupula 0 1^a. 25 2^a. fere adijcienda part. 0. 57 1^a. 10 2^a. vt existat emendata & absoluta æquatio orbis partis 0. 57 1^a. 35 2^a. adiungenda æquali motui ☉. simplici. quia coæquata anomalia maior est semicirculo. Verus igitur locus ☉. à prima stella ♀. habet sexag. 0. part. 57. 52 1. 4 2^a. Tandem huic arcui adiecta vera præcessio partium 26. 59 1^a. 29 2^a. monstrat locum ☉. verum ab adparenti æquinoctio sexag. 1. par. 4. 51 1^a. 33 2^a. id est. Solem versari circa finem quinti gradus tertij dodecatemorij. quod Geminis adscribitur Hæc est prior ratio.

IN POSTERIORE ratione sumes primùm loco veræ præcessionis ipsam Prosthaphæresin cum ea cautione. vtrum addenda sit vel subtrahenda. cuius rei indicium facit anomalia simplex æquinoctiorum postquam fuerit duplicata. vt supra in x. præcepto traditum est. Deinde loco æqualis motus simplicis sumito æqualem Solis motum compositum. Cætera quæ de æquationibus tam centri. quàm orbis dicta sunt. eodem modo se habent. sicut prius. Et absoluta illa annui orbis Prosthaphæresis si vel addatur. vel subtrahatur motui ☉. composito secundum prius dicta. patefaciet distantiam adparentis loci ☉. à medio æquinoctio. cui si rursum Prosthaphæresin æquinoctiorum addas vel demas. vt præcepti ratio postulat. habebis tandem verum locum ☉. ab æquinoctio apparente. Vt ad idem tempus nostrum inuenta est Prosthaphæresis æquinoctiorum addenda partis 0. 40 1^a. 5 2^a. compositus autem motus ☉. 1. sexag. 3. 13. 53. per anomalam igitur illam simplicem sexag. 2. part. 42. 55 1^a. 6 2^a. & anomalam Solis annum æqualem sex. 5. par. 25. scr. 28 1^a. 56 2^a. colligitur absoluta tandem Prosthaphæresis orbis par. 0. 57 1^a. 35 2^a. vt prius. quæ adiecta æquali motui ☉. composito. ostendit veram distantiam ☉. à medio æquinoctio sex. 1. par. 4. 11 1^a. 28 2^a. Cui rursus adiecta Prosthaphæresis æquinoctiorum part. 0. 40 1^a. 5 2^a. conflat eiusdem veri loci ☉. distantiam ab adparenti æquinoctio 1. sex. 4. par. 51 1^a. 33 2^a. omnino vt prius Vides igitur quàm subtiliter viriſq; calculi ratio inter se consentiat.

XVI. PRAECEPTVM. DE LOCO MEDIJ

& veri apogei Solis

Locus apogei ☉.

Primùm de apogei medij loco hæc duo tenenda sunt. Alterum si subtraxeris motum anomalæ æqualem à motu eiusdem simplici æquali. relinquetur æqualis motus seu distantia apogei medij à prima stella Arietis. alterum verò. si eundem anomalæ motum deduxeris à motu ☉. composito. æqualem ab æquali. reliquus fiet motus eiusdem apogei medij à medio æquinoctio.

Quare

Quare si ad datum tempus aliquod inuentus ita fuerit motus seu distantia apogei medij a prima stella γ . posthaphæresis centri \odot . addita vel subtracta, contra quam calculi ratio in prioribus exigebat, monstrabit tibi locum veri apogei ab eadem prima stella, cui si rursus adiunxeris veram præcessionem verni æquinoctij, habebis locum veri apogei ab apparente æquinoctio, vt ad datum tempus natalicium inuenta sunt prius hæc. Motus æqualis \odot . simplex \odot . sexagen. 36. part. 54. 1^a , 29 2^a , anomalix annuæ æqualis 5. sexag. 25. part. 28 1^a , 56. 2^a . Distantia ergo medij apogei \odot . a prima stella γ . est 1. sexag. 11. par. 25 1^a , 33 2^a . Ac inuenta est in præcedenti calculo ad idem tempus Prosthaphæresis centri 2. par. 28 1^a , 5 2^a , subtrahenda in hoc negotio cum prius adiungeretur, ac propterea veri apogei locus aberit ab eadem stella 1. sexag. 8. partibus 57. 1^a , 28. 2^a . Hic tandem adiecta vera præcessio partium 26. 59. 1^a , 29. 2^a , ostendit verum apogeon \odot . abfuisse tunc ab adparenti æquinoctio 1. sexag. 35. parti. 56 1^a , 57 2^a . id est, hæsisse in fine 6. partis dodecatemorij \odot . post lineam solstitialem, quemadmodum anno 1551, hæret in extremo partis octauæ eiusdem \odot .

Sed si ad datum tempus inuenta fuerit distantia medij apogei a medio æquinoctio, inuenies primum similiter distantiam veri apogei a medio æquinoctio. Quod si Prosthaphæresin æquinoctiorum addendam quidem adieceris, auferendam verò abstuleris, exhibit distantia veri apogei ab adparente æquinoctio. Vt ad datum nostrum tempus, motus \odot . æqualis compositus est 1. sexag. 3. part. 13 1^a , 53 2^a , vnde ablatus motus annuæ anomalix prior relinquit 1. sexag. 37 partes 44 1^a , 57 2^a . distantiam videlicet medij apogei ab æquinoctio medio. Hinc ablata Prosthaphæresis centri \odot . partium 2. 28 1^a , 5 2^a , reliquam facit distantiam veri apogei a medio æquinoctio 1. sex. 35. par. 16 1^a , 52 2^a , cui adiuncta Prosthaphæresis æquinoctiorum, vt est adiecticia, efficit distantiam veri apogei ab adparenti æquinoctio 1. sex. 35 part. 56 1^a , 57 2^a , planè, vt prius: poteris & hac forma vri. Aequali mot. \odot . simplici adde veram præcessionem, & ab hac summa deducito anomaliam \odot annuam coæquatam, relinquitur enim mox distantia veri apogei ab adparenti æquinoctio, quemadmodum huius formæ calculum ordine subiecimus ad datum nostrum tempus.

XVII. PRAECEPTVM. DE CALCULO ECCENTROTETIS ☉ ad datum tempus.

folio 97 6

*πρὸς τὸ ἐκκεν-
τρώσειν
τὸ ἡλίου,*

Media

36945

Exhibuimus tibi inter ceteros Canonem Eccentrotetis ☉. in quo maxima est particularum 41700. & minima omnium 32190. quarum semidiameter Ercentrici ☉. 1000000. vt sit differentia maximæ & minimæ Eccentrotetis earundem 9510. Ad datum ergo aliquod tempus, vt sine molestia discas, quanta sit Eccentrotetis ☉. ingredere eum Canonem cum anomalia æquinoctiorum simplici. & facta correctione, si vsus postulat, ex cerpes mox quæsitam ἐκκεντρώσειν, vt ad natalicium tempus Illustriss. Ducis Borussiae inuenta est anomalia simplex ac prima 2. sexag. 42. part. 55^a fere, quæ sunt partes 162.55^a. Vides autem partibus 162. euenire ἐκκεντρώσειν particularum 32457. & inde vni gradui debentur 28. particulæ abijciendæ. Ideo partibus 162.55^a, iuxta doctrinam partis proportionalis congruit iusta Eccentrotetis particularum 32431. quarum semidiameter Eccentri ☉. 1000000. Tanta scilicet fuit Eccentrotetis orbis ☉. cum Illustriss. Princeps in hanc lucem nasceretur.

Quod si scire libet, quanta fuerit Eccentrotetis in partibus quarum Ptolomæi exemplo eccentri semidiameter adsumitur 60. multiplicato inuentam eccentroteteta 32431. per 60. & diuide in particulas 1000000. & reliquum multiplicatum rursus per 60. similiter partire. Idq; facito, quousq; visum fuerit. Inuenies igitur eodem tempore fuisse Eccentroteteta orbis ☉. 1. par. 56^a 1^a, 45^a 2^a, quarum semidiameter Eccentri ☉. 60.

Ad eundem quoq; modum erit maxima Eccentrotetis partium 2. 30^a 1^a, 7^a 2^a, & minima partis 1. 55^a 2^a, vt sit vtriusq; differentia partis 0.34^a 1^a, 14^a 2^a, quarum est eccentri ☉. semidiameter 60.

XVIII. PRAECEPTVM DE MOTV ☉ DIVRNO inquirendo ad datum diem dati anni vel à Christo, vel ab alia quacuncq; Epochâ.

*πρὸς τὸ ἡμε-
ρῶς κινῆσαι
τὸν ἥλιον.*

Rectissima via hæc est, vt primum inquiras motum ☉. adparentem ad meridiem dati diei iuxta doctrinam præcepti, & inde ad meridiem vel antecedentis diei vel sequentis. Nam intra biduum vel triduum mutatio motus ☉. sensu saltem percipi non potest. Postea aufer motum prioris diei à motu posterioris. Reliquus enim arcus est quæsitus motus ☉. diarius. Vt sit huius anni 1551. datus, dies 16. Maij, quo sci-
re ve-

revelim motum Solis diurnum. Inuenio igitur iuxta præceptum ad meridiem 16. Maij motum ☉ adparentem 1. sexa. 3. 57 1^a, 29 2^a, ab æquinoctio adparente. Similiter ad meridiem, sequentis diei 17. Maij motum ☉ adparentem 1. sexag. 4. part. 55 1^a, 3 2^a. Prioris ergo diei motus ablatas à motu posterioris ostendit eo tempore fuisse motum ☉ diarium 0 part. 57 1^a, 34 2^a. Ac ne quid hoc loco desideret studiosus, subieci calculi eius præcipua membra.

Ad meridiem 16. diei. Vera præcessio æquinoctiorum 0. sexag. 36. part. 28 1^a, 4 2^a.

Anomalia simplex	2	49	19	1
Duplicata	5	38	38	2
Anoma. ☉ annua æqualis	5	23	27	27
	Sex. par.	1	11	
Æquatio centri ☉.	0	1	33	51 Add.
Coæquata anomalia	5	25	1	18
Scrupula propor.	0	0	0	36
Æqualis motus ☉ simplex	0	55	19	2
Absoluta æquatio orbis	0	1	1	59 Add.
Verus ☉ à prima stella V.	0	36	21	1
Ad meridiem verò 17. diei Maij				
Anomalia coæquata	5	26	0	27
Æqualis motus ☉ simp.	0	36	18	10
Absoluta æquatio	0	1	0	25 Addenda
Verus motus ☉.	0	37	18	35 à prima stel. V.

Cætera enim non subito variantur. vt vera præcessio, æquatio centri, & scrupula proportionum.

Dabo tibi & alium modum expeditiorem ex canone motus ☉ horarij, quem in hunc usum præparauimus. Eum Canonem, cum anomalia ☉ annua coæquata ad datum tempus ingredi sub conuenienti Eccentrotete, vel minima, vel media, vel maxima, ita vt partem proportionalem sumas ad 10 gradus, secundum quos saltum ibi facit eadem anomalia. Sic facillimè comparabis tibi motum ☉ diarium. Vt in proximo exemplo, quia & Eccentrotetes ☉ penè minima est, & anomalia ☉ coæquata 5. sexa. 26. part. 0 1^a, 27 2^a. id est, partium 326. ferè, Ingressus Canonem cum partibus quidem 320. video motum diarium sub minima Eccentrotete scr. 57 1^a, 41 2^a, sed cum partibus 330. eundem scrupulorum 57 1^a, 31 2^a, vt interuallo 10. gradum anomalie decrescat motus diarius 10. secundis. Ideo ad 326. gradus anomalie existit motus ☉ diarius scr. 57 1^a, 35 2^a, quod cum priori consentit.

Verum quia sæpe fit, vt eccentrotetes Solis nec sit maxima, nec media,

nec minima, quomodo ex hoc canone non solum expedire, verum etiam quam scrupulosissime veneris motum ☉. diarium, hic accipe. Per simplicem anomaliam obliquitatis colligito ex Canone Prosthaphæreseon Solis scrupula proportionum, ea inquam, per quæ ipsa orbis ☉. Prosthaphæresis omnibus numeris absoluta existit. Iuxta hæc scrupula sumito partem congruentem de differentia vtriusq; motus ☉. diarii respondentis anomalie ☉. coæquate, tam in minima, quam maxima Eccentrotete. Eam deniq; partem congruentem motui ☉. diarii ad minimam Eccentroteta adde, si ad eandem motus diarius fuerit minor, vel aufer, si fuerit maior. Quod enim hoc modo existit, habebis pro motu ☉. diario satis emendato. Vt ad datum aliquod tempus esto anomalia simplex 1. sex. 57. par. vel partium 117. per quam habentur ex canone Prosth. solis scrupula proportionalia 18. Sit verò & annua ☉. anomalia coæquata partium 30. per quam motus ☉. diarius minimæ Eccentrotetis colligitur 57 1^a, 3 1^a, 2^a, scrupulorum, maximæ vero 57 1^a, 3 2^a, scr. ut sit differentia 28 2^a, scr. quibus maior est motus diarius minimæ quam maximæ. Iam de his 28 2^a, scr. pars congruens 18. scr. proportionalibus est 8. secundorum scrupulorum, ferè abijcienda, eo quod in maxima Eccentrotete minor erat motus. Proinde diarius motus ☉. ad datum tempus & locum anomalie 57 1^a, 23 2^a, scrup.

Cæterum hoc præceptum de motu diurno traditum transferri potest similiter ad motum tridui, quadridui, vel maioris etiam spacii, quod monuisse nunc satis est. Supra enim in 14. præcepto planè similem rationem secuti sumus, & sagax lector præcepta ad speciem accommodata conuenienter seu ἀναλογικῶς discet ad genus ipsum transferre.

XIX. PRÆCEPTVM, DE MOTV SOLIS HORARIO, data eius annua anomalia coæquata.

ἡμερησίῳ κινῆ-
ματι τῆς ἡλίου

Iuxta præcedens præceptum inuenias primò motum ☉. diarium, cuius singulas partes infer in Canonem vicissimæ quartæ contiguum Canonis motus ☉. diurni. Ita enim motum horarium sine vlla molestia expedire venaberis. Verum hæc breuiter, vnum exemplum illustrauerit. Sit enim per antecedentia motus ☉. diarius inuenius scrupulorum 57 1^a, 3 5 2^a, siue ex anomalia ☉. coæquata, siue etiam altero modo. Scire velim motum horarium. In dictum Canonem vicissimæ quartæ infer primùm 57 1^a, scr. quibus respondere vides scr. 2 1^a, 22 2^a, 30 3. Rursum 35 2^a, respondent scr. 1 2^a, 27 3^a, 30 4^a. Hæc iam ritè coaceruata exhibent motum horarium scr. 2 1^a, 3 2^a, 57 3^a, 30 4^a, vel scr. 2 1^a, 4 2^a, abiectionis nimirum tertij & quartis.

XX. PRÆCEPTVM, DE RATIONE CONDENDI Canonem motus ☉. diarii ad quoduis datum tempus, vel ad quamlibet datam Eccentroteta.

Esti

Esti Canonem motus \odot diarii accurate supputauimus, seruientem
 Eccentroteti Solis tum maximæ, tum mediæ, tum minimæ, tamen si
 quis vel ob supputationem Epheme. vel ob alias causas velit ad certi
 temporis ~~exnegotia~~ in promptu habere Canonem diarii motus \odot .
 huic viam aperiemus, vt sua industria id, quod experit, consequatur.
 Usitatum est autem in huiusmodi canonibus equalia seruare interual-
 la, nempe vt calculus subducatur ad gradus singulos, vel binos, vel ter-
 nos, vel quinos, vel aliter pro cuiusq; arbitrio & commoditate. Ac ne
 prolixitate orationis offendi queat lector æquus & studiosus, rem ip-
 sam mox aggrediamur. Esto autem exempli gratia datus annus Domi-
 ni 1013. quo anomalia æquinoctiorum simplex erat partium 115. per
 quam ex Canone Prosthap. \odot . colliguntur scr. proportionalia 20 1^a,
 0 2^a. Vnum enim secundum in tali negotio iure negligitur. Liber iam
 condere huiusmodi Canonem congruentem isti seculo, ex quo Cano-
 ne per coæquatam anomaliæ diarius motus \odot . mox depromatur. Esti
 autem in vsu Canonis necessarium est nosse locum apogei solaris, ta-
 men interea nihil refert eum a nobis ignorari. Tribus igitur exem-
 plis omnem complectemur varietatem, in quorum primo sumemus,
 quod Sol versetur in ipso apogeo, in altero quod ab eodem apogeo di-
 ster partibus 45. in tertio deniq; partibus 110. Est autem motus diu-
 nus \odot . æqualis scrupulorum 59 1^a, 8 2^a, cuius dimidium 29 1^a, 34 2^a.
 Quia enim inuestigamus motum \odot . diarium, quando anomalia eius
 coæquata vel nihil est, vel part. 45. vel partium 110. oportet nos quærere
 æquationem orbis absolutam ante & post hæc 3. loca scr. 29 1^a, 34 2^a.

Primum ergo de apogeo. Anomaliæ coæquatæ partium 0. 29 1^a,
 34 2^a, respondet absoluta æquatio, orbis scr. 1 1^a, 1 2^a, quanta etiam re-
 spondet anomaliæ coæquatæ partium 59. 30 1^a, 26 2^a, quia ambo lo-
 ca ab apogeo æquis absunt interuallis. Aequatio ergo duplicata, nempe
 scr. 2 1^a, 2^a si auferatur ab æquali motu diario (quia in apogeo motus
 est tardissimus) ostendit verum diarium Sole per apogeon transeunte
 scrupulorum scilicet 57 1^a, 6 2^a. At in perigeo Eccentri similis æquatio
 tota adijcienda est ad æqualem motum, cum Sol in ea parte orbis citissi-
 me ferri videatur. Nunc de altero loco. Primum coæquata anomalia
 \odot partium 44. 50 1^a, 26 2^a, exigit æquationem orbis absolutam partitū
 1. scr. 23 1^a, 4 2^a, subtrahendam. Rursus coæquata anomalia partium
 45. 29 1^a, 34 2^a, exigit orbis æquationem absolutam partis 1. 24 1^a,
 33 2^a, scilicet idem subtrahendam. Et quia hæc præstior æquatio adhuc
 maior est, quam prior scrupulo 1 1^a, 29 2^a, ideo differentia ab æquali
 motu diurno subtrahenda est. verus igitur motus diarius solis tran-
 seuntis per 45. gr. ab apogeo est scr. 57 1^a, 39 2^a. Tandem de reliquo

apogeo.

loco ex 3. propositis. Anomalie Solis coequatæ partium quidem 109
scr. 30 1^a, 26 2, rursus congruit absoluta orbis æquatio partis 1. scr.
55 1^a, 56 2^a sed partium 110, scrupulorum 29 1^a, 34 2^a, congruit equa-
tio partium 1. scr. 55 1^a, 16 2^a, differentia utriusq; æquationis est scr. 0
1^a, 40 2^a, addenda nunc æquali motui, eò quòd posterior æquatio tan-
tum à priori decreuit, cum utraq; esset auferenda Verus igitur motus
diarius Solis per 110. gradū ab apogeo transeuntis est scr. 59 1^a, 48 2^a,

Cæterum quia loca utriusq; semicirculi ab apogeo æqualiter remo-
ta æqualibus fruuntur Prostaphæresibus, oportet in iisdem quoq; lo-
cis diarios ☉ motus inter se convenire, ut Sol per 45. & 315. partem
ab apogeo in consequentia exæquat apparentes suos cursus diarios,
item per 110 & 240. ab eodem apogeo. Nam hæc loca in diuersis se-
micirculis æqualiter distant, siue ad apogeon referas eorum intervalla,
siue ad perigeon.

Postremo Eccentrotetis mentionem in propositione nostra fecimus
ideo, quia sensibilis eius mutatio priores canones huius generis abo-
let, & novos flagitat, colligitur autem per anomaliam obliquitatis Ec-
centrotetis nostro exemplo conveniens particularum 35360. quarum
semidiameter 1000000 vel partium 37 1^a, 18 2^a, quarum eadem se-
midiameter 60. quod obiter adiecinus.

XXI. PRAECEPTVM DE CALCULO AD PAREN- tis magnitudinis tropici anni ad datum tempus.

πῶς τὸ ἐν-
αὐτῷ τῷ πῶς
κὲν φάτο
πῶς
Ἰνδερὲν ἀν-
νῶς.
Tropicus
vertens.

Annus naturalis duplex est, fiderius & tropicus, fiderium voca-
mus spacium temporis, quo sol ad eandem stellam inerrantem reuer-
titur, quod fit diebus 365. horis 6. ac præterea scrupulis 9 1^a, 39 2^a,
vnius horæ ex Thebitij & Copernici sententia, sicut alio loco copiosius
declaratum est. Tropicus verò annus, quem Latini vertentem nomi-
nant, est spacium temporis, quo Sol emensus totam Zodaici longitu-
dinem redit ad idem vel solsticiū vel æquinoctium. Nam quia ob-
servationes motus ☉. factæ circa solsticia haud satis firmæ ac constan-
tes sunt, quòd eius declinatio aliquod dierum intervallo nullam tunc
oculis obijciat varietatem, posteriores artifices easdem observationes
de tropici anni magnitudine referre ad æquinoctia maluerunt, iuxta
quæ subita declinationis Solis mutatio certum etiam de hora æquino-
ctij indicium facit quemadmodum hæc in primis Elementis & alibi
explicantur. Est autem hic Tropicus annus adparens semper tūm mi-
nor anno fiderio, propterea quòd æqualis motus præcessionis semper
excedit id quòd interdum ratione anomalie ab eo auferendum est, tūm
etiam sui dissimilis propter quatuor causas, quas primus Nicolaus
Copernicus dexteritate, & solertia sua tandem deprehensas enuncia-
vit,

Quatuor cau-
sa inæquali-
tatis anni.

uit. Hæ sunt inæqualis præcessio æquinoctiorum. vel sectionum æquinoctialium. Anomalia motus Solis in Zodiaco, mutatio deniq; tum Eccentrotetis, tum apogei, æ quibus causis sola anomalia per se non magni momenti cognita fuit Ptolomæo. Quapropter tota posteritas grato animo Copernici nomen celebrabit, cuius labore & studio doctrina ipsa cælestium motuum propemodum collapsa iterum restituta est, & magna eius quoq; lux Dei beneficio accensa inuentis & patefactis ab eo multis, quæ ad hanc vsq; ætatem vel ignota fuerant, vel obscura. Sed redeo ad propositum ac breuiter nunc monstro simplicissimam calculi formam.

Ad quemcunq; diem dati anni subducito calculum veræ præcessionis æquinoctij iuxta doctrinam X. Præcepti, & similiter ad eundem diem anni proximè sequentis priorem auferre à posteriori. vt constet, quantum præcesserit verum æquinoctium intra anni circuitum. quemadmodum in XII. Præcepto docuimus. Hanc præcessionem annuam partire in motum æqualem Solis horarium, qui est scrup. $21^a, 272^a, 503^a$, inde quæ exeunt horarum scrupula auferre ab æquali anno sidereo, quem diximus esse dierum 365 . horarum 6 . scrup. $91^a, 392^a$ Reliquus enim numerus ostendet quæsitam anni tropici adparentem magnitudinem. Subijciam verò nonnulla exempla, ex quibus dissimilitudo, de qua dixi, aliquo modo conspiciatur.

Præceptum.

Primum exemplum. Ad diem natalem inclyti Ducis Borussiae supra in X. Præcepto inuenta est vera præcessio partium 26 . scrup. $591^a, 282^a, 543^a$. Similiter inuenietur integro anno post eodem die partium 27 . scrup. $01^a, 62^a, 93^a$, vt sit differentia vtriusq; præcessionis scrupulorum $372^a, 153^a$, quæ diuisa per motum ☉. æqualem horarium scrup. $21^a, 272^a, 503^a$, exhibent horæ vnus scrupula $151^a, 72^a$, ferè. Iam hæc ablata ex anno sidereo dierum 365 . horarum 6 . scrup. $91^a, 292^a$, relinquunt anni Tropici adparentem magnitudinem, videlicet dierum totidem, horarum 5 . scrup. $541^a, 222^a$, Tanta fuit eo tempore adparentis anni tropici magnitudo.

Exempla.

1.

Alterum exemplum. Ad meridiem XI. diei Martij huius anni 1551. colligitur vera præcessio verni æquinoctij partium 27 . scrup. $361^a, 212^a, 553^a$, similiter ad meridiem 10. diei Martij sequentis anni 52. eadem colligitur partium 7 . scrup. $361^a, 572^a, 313^a$, vt posterior superet priorem scrupulis $351^a, 362^a$, quæ distributa in motum ☉. horarium dant scrupula $151^a, 72^a$, vnus horæ auferenda ab æquali anno sidereo. Ideo cum hos canones cælestium motuum auspicio Illustrissimi Ducis Borussiae æderemus erat adparens Tropici anni magnitudo præter dies integros horarum 5 . scrup. $551^a, 122^a$, nimirum adhuc cre-

2.

*Annus Tro-
picus medi-
us.*

*Propositi-
on-
m. 1. 1. 1.*

3 scens. ut sit iam paulò maior, quàm Ptolomæi tempore, cuius calculu-
iam sequitur. Tertium exemplum. Ad initium anni Domini 140 col-
ligitur vera præcessio part. 6. scr. 40 1^a, 33 2^a 23^a, sed ad initium se-
quentis anni 141 par. 6. scr. 41 1^a, 11 2^a, 41 3^a, ut posterior præcessio
excedat priorem scrupulis 38 1^a, 39 2^a, vnius gradus, quæ distributa
in motum ☉ horarium æqualem præbent scrupula 5 1^a, 41 2^a, vnius
horæ abijcienda ex æquali anno fidere. Itaq; circa eum annum Domi-
ni quo Ptolomæus & stellas fixas & anni magnitudinem accurata ob-
seruatione considerauit, fuit anni adparens magnitudo iuxta nostrum
calculus dierum 365, horarum 5. scr. 53 1^a, 58 2^a. quanta ferè hoc no-
stro tempore rursum existit. Nam quod Ptolomæus anni magnitudi-
nem paulò maiorem sua ætate tradidit, & quidem arbitratus est, semper
manere eandem sine vlla mutatione, videlicet, præter dies integros &
horas scrupulorum 55 1^a, 12 2^a, ut in 300 annis totus dies interciderat,
id suam excusationem habet de qua ab alijs eruditè scriptum est, & nos
alibi differemus, Deo iuuante. Cæterum tropicus annus æqualis, qui
refertur ad medium æquinoctium præter dies integros est iuxta obser-
uationes, & Copernici Hypotheses horarum 5, scr. 49 1^a, 16 2^a, horæ
vnius, quemadmodum & Alphonsini ferè tradiderunt, quorum æqua-
lis motus ☉ diarius vix in quartis scrupulis distat ab eo, quem Co-
pernicus vocat compositum. Adieci autem infra canones anni tum
fiderei, tum Tropici æqualis duplici forma, in quorum priori sexa-
genariam rationem secuti sumus, in posteriori autem solos excessus
indicauius, penes quos anni vel fiderei, vel Tropici æquales quot-
cunq; maiores sunt totidem annis Aegyptijs, quorum Canonum ali-
quem vsum paulò post monstrabo. Postremò cum hic calculus circa
minima versetur, consultum est æquales motus præcessionis & ano-
malix simplicis colligere, vel iuxta Copernici viam, vel Alphonsinam,
eò quod canon vulgaris formæ tertia scrupula graduum non suppedi-
tat, vnde vnius aut alterius secundi scrupuli facile potest accidere.

XXII. PRAECEPTVM. QVA RATIONE CALCULI

exploretur dies & hora apparentis vel æquinoctij vel solstitij.

Non dubium est solem conficere vernum æquinoctium cum tanto
intervallo adhuc præcedit primam Stellam ♀, quantum interiectum est
inter ipsam vernam sectionem vtriusq; circulorum Aequinoctialis atq;
obliqui, & eandem stellam: ut hoc anno 51. vera præcessio est par. 27.
36 1^a, 22 2^a, ferè circa diem æquinoctij, nempe vndecimum Martij.
Constat igitur verum æquinoctium confici, dum Sol antecedit ad-
huc primam stellam ♀. totidem partibus & scrupulis, solstitium verò
æstiuum, dum Sol recessit in consequentia ab eadem stella non toto qua-
drante

drante circuli, sed minus partibus 27. scr. 36^{1^a}. 22^{2^a}, similiter autumnale æquinoctium, quum recessit ab eadem non prorsus toto semicirculo, sed demptis inde partib. rursus totidem, atq; scrupulis. solstitium deniq; hibernum. seu brumam, cum digressus est iam Sol non integro dodrante circuli, sed cui desint similiter totidem partes & scrupula. Tantum de locis æquinoctiorum & solstitiorum in Zodiaco, supra in fine X. Præcepti breuiter monuimus. Quomodo autem calculo exploretur dies & hora æquinoctij, vel solstitij, etsi ad Ephemeridum tractationem seu doctrinā magis hoc pertinet, tamen non grauabor eius rei exemplum hoc loco subiungere. Primum autem dies æquinoctio aut solstitio proposito proximus singulis ætatibus ferè communi quadam vulgi obseruatione notus est. Vt dies proximus verno æquinoctio hodie est 11. Martij, autumnali 13. Septembris, solstitio æstiuo duodecimus Iunij, brumali deniq; solstitio dies item duodecimus Decembris, sed ad alia quæcunq; tempora non præsentia sed præterita aut futura, nisi vel ex historijs, vel aliunde notus sit huiusmodi proximus dies, explorari poterit experimento calculi motus ☉. ad certum diem, quia Sol singulis diebus singulos ferè gradus peragrat. Ad meridiem talis proximi diei subducito calculum veri morus ☉. iuxta doctrinam XV. Præcepti, vnde constabit, quantum absit ab illo vel æquinoctio vel solstitio retrò aut post. Hinc iuxta XVIII. Præceptum exquire motum ☉. diurnum adparentem eius loci, per eumq; diuide illam distantiam ☉. multiplicatam prius in 24. horas. Sic enim colliges diem & horam æquinoctij. Sed venio ad exemplum, quod plura etiam monebit attentum lectorem. Hoc igitur anno ad Meridiem XI. diei Martij fuit locus ☉. adparens sub meridiano Regij montis Prussie in 29. parte, 42^{1^a}, 11^{2^a}, scr. dodecatemorij X. Nondum igitur transijt Sol locum æquinoctij, sed ab eo ad huc abest scrupulis 17^{1^a}, 49^{2^a}, vnus gradus. Et motus diurnus reperitur scrupulorum 59^{1^a}, 24^{2^a}. Multiplicata igitur scrup. 17^{1^a}, 49^{2^a} per 24. horas gignunt 77.30. quæ diuisa per scrupula 59^{1^a}, 24^{2^a}, dant horas 7. scrup. 12. ferè. Æquinoctium igitur fit 7. horis scrup. 12. post meridiem 11. diei Martij. Quod si Sol superasset locum æquinoctij scrupulis 17^{1^a}, 49^{2^a}, momentum etiam illius æquinoctij antecessisset meridiem 11. diei horis 7. scrupulis 12. Idem fit & in cæteris quatuor cardinibus temporum. Verum satis est verborum de hoc præcepto.

XXIII. PRAECEPTUM IN DATO ANNORVM

numero, quando Sol ad datum ab adparenti æquinoctio punctum Zodiaci reuertatur.

Hoc Præceptum pertinet ad *ἡμερῶν γενεθλίας λογικῶν*, quia docet de *De conuersione* tempore conuersionis, seu vt vulgò vocant, reuolutionis annuæ vel nati *nibus anni* alicuius, vel alterius cuiuscunq; rei. Tunc n. annua cōuersio certi alicuius *initij*

ἐναλλὰς

ἐνταυτοῖς

*Dud modi
seu formæ.
Prior,*

initij fieri intelligitur, cum Sol penitus eodem interuallo abeſt ab adpa-
rente æquinoctio, id eſt cum ad eundem locum eiſdem dodecatemoriij
reuerſus eſt, quem tempore dati illius initij occupauerat. Eſi autem in
Ephemeridibus noſtris trademus planè facilem & vulgarem rationem
inueniendi huiusmodi tempora annuarum conuerſionum, tamen vt
tùm fontes eiſ rationis, tum vſus noſtrorum canonum ea quoq; in par-
te conſpiciatur, duos modos nunc ſubiungemus. quorum prior planiſ-
ſimus eſt, & mediocriter etiam doctis in mentem venit, quoties de hac
conuerſionum doctrina cogitant. Eſt autem eiſmodi. Ad principium
illius rei ſit vel datus, vel abſte inuentus verus locus ☉. ab adparenti æ-
quinoctio. Poſtea conſimili modo, quo in præcedenti præcepto de hora
æquinoctij & ſolſtitij vſi ſumus, inueſtigas, quando Sol ad eundem lo-
cum reuertatur. Hoc enim erit tempus annuæ conuerſionis. Verùm vt
res fiat planior, ſubijcio exemplum inclyti Ducis Boruſſiæ, ad cuius na-
taliciam horam inuentus eſt verus motus ☉. ab adparenti æquinoctio
in ſcrupulo 51 1^a, 33 2^a, quinti grad. II. vel tertij dodecatemoriij. Ve-
lim nunc ſcire, quo die, & quo momento horæ Sol ad eundem locum
Geminorum redeat plenis iam vel conſectis annis 61, quod incidit in
annum hunc 1551. Cum autem in hoc annorum numero nec æqui-
noctia, nec ſolſticia, nec aliæ dodecatemoriarum partes multum antici-
pent ſeu præcurrant ſuos primos dies, conſentaneum eſt annuam ☉.
conuerſionem fieri eodem propemodum die 17 Maij, quo ante annos
61, natus eſt Dux Illuſtiſ. Quare iuxta doctrinam XV. Præcepti ex-
ploro locum ac inuenio eundem meridiano tempore 17, diei Maij
in Horizonte Regiono montano conſeciſſe ab adparenti æquinoctio partes
64. ſcr. 55 1^a, 33 2^a, id eſt, ſupergreſſum iam eſſe locum natalicium ſcru-
pulis 3 1^a, 30 2^a. Vnde manifeſtum eſt, quòd eo die Maij huius anni
1551. tempus annuæ conuerſionis paululum antecedit horam meridi-
anam. Eſt autem motus diurnus ☉. adparens in hoc loco Zodiaci na-
talicio ſcr. 57 1^a, 33 2^a ferè. & horarius ſcrupulorum 2 1^a, 23 2^a, 53
3^a, in quem horarium diſtributa ſcrupula 3 1^a, 30 2^a. differentiæ oſten-
dunt horam 1. ſcr. 27 1^a, 30 2^a ferè. Quare hoc anno 1551, fit annua
natalicij temporis conuerſio ante meridiem XVII. diei Maij hora vna
integra, ac ſcr. præterea 27 1^a, 30 2^a. id eſt, poſt horam decimam ante-
meridianam ſcrupulis 32 1^a, 30 2^a ferè. Hæc eſt prima ac velut regia
via nota omnibus mediocriter eruditis, in qua nihil perplexi eſt, nihil ob-
ſcuro, & ad quam ceu Lydium lapidem cæteri modi omnes examinari
poſſint.

Posterior.

ALTER. modus initio videtur obſcuriorem calculi rationem, ma-
gisq; intricatam adferre ſed mediocriter ad eum adſue factis, & aman-
tibus huius doctrinæ fontes multo erit gravior, non ſolum quia ali-
quid

quid compendij habet, verum quia omnes quatuor causæ, quæ anni magnitudinem variant, admodum perspicue hic comparent. Præcepti partes ordinè recenseo. Primum ad horam nataliciam habeas inuentam veram æquinoctij præcessionem, similiter & absolutam $\pi\sigma\theta\delta\alpha\phi\alpha\iota\gamma\epsilon\sigma\theta\iota$ orbis . per eius coarquatam anomaliam. Similiter ad illum diem, quo futura est annua conuersio, habeas eadem duo in promptu præcessionem dico, æquinoctij veram, & Prosthaphæresin orbis absolutam. Priorem præcessionem aufer à posteriori, & hanc differentiam præcessionum interea adserua. Similiter Prosthaphæresin orbis \odot . alteram subtrahe ab altera. Hæc differentia aliàs addenda est. aliàs auferenda differentie præcessionum, addenda quidem quando posterior æquatio orbis vel adijcienda crescit, vel subtrahenda decrescit, auferenda verò, quando eadem posterior æquatio orbis vel adijcienda decrescit, vel subtrahenda crescit. Quod iam hoc pacto de vtraq; differentia vel colligitur, vel relinquitur, distributum in motum \odot . horarium æqualem scrupulorum $2\ 1^a\ 27\ 2^a\ 50\ 3^a$, (quem antea quoq; in calculo magnitudinis anni usurpauimus) ostendit horas & earum scrupula, quibus conuersio annua antecedit totidem annos fidereos. Videramen, vt bisexti rationem in hoc negotio cautè obserues. Repeatur prius exemplum. Ad natalicium tempus inelyti Ducis vera præcessio est partium 26 . scrup. $59\ 1^a\ 28\ 2^a\ 47\ 3^a$, & Prosthaphæresis orbis \odot . absoluta part. 0 . scrup. $57\ 1^a\ 35\ 2^a$, addenda. Similiter annis 61 . post, ad meridiem eiusdem diei 17 . Maij vera præcessio est part. 27 . scrup. $36\ 1^a\ 28\ 2^a\ 26\ 3^a$, & Prosthaphæresis orbis absoluta part. 1 . scrup. $0\ 1^a\ 30\ 2^a$, addenda rursus. Differentia igitur præcessionum est scrup. $36\ 1^a\ 59\ 2^a\ 39\ 3^a$, sed Prosthaphæreseon differentia est scrup. $2\ 1^a\ 55\ 2^a$, quæ addenda est differentie præcessionum ideo, quia addenda Prosthaphæresis orbis posterior maior est priori. Summa igitur vtriusq; differentie est scrupulorum $39\ 1^a\ 54\ 2^a\ 39\ 3^a$, quæ diuisa in motum \odot . æqualem horarium scrup. $2\ 1^a\ 27\ 2^a\ 50\ 3^a$ ostendit horas 16 . scrup. $11\ 1^a\ 51\ 2^a$, ferè, quibus annua conuersio antecedit 61 . annos fidereos. Ex Canone autem nostro vulgari anni fiderei æqualis superant 61 . anni fiderei totidem Aegyptios diebus 15 . horis 15 . scrup. $48\ 1^a\ 39\ 2^a$. Suntq; ab anno 1400 . vsq; ad annū hunc currentem 1551 . per se intercalati dies illi 15 . quod sic etiam deprehendes, si vtrumq; numerum annorum per 4 . diuidas. Quotus enim numerus posterior superat priorem 15 . unitatibus. Quare reliquæ 15 . horæ scrup. $48\ 1^a\ 39\ 2^a$, additæ horis. 10 . scrup. 56 . vt à media nocte præcedente decimum septimum diem Maij numeratis conficiunt horas 26 . scrup. $44\ 1^a\ 39\ 2^a$, ita vt 61 . annus fidereus à natalicio momento sit plenus vel exactus horis duab. scrup. $44\ 1^a\ 39\ 2^a$

post mediam noctem, quæ diem 17. Maij sequitur. At annua conuersio antecedit annos fideos 61. vt dictum est. horis 16. scr. 11 1^a, 51 2^a. Ablatis igitur horis 16. scr. 11 1^a, 51 2^a, ab horis 26. scr. 44 1^a, 39 2^a, adparet annuam conuersionem fieri horis 10. scr. 32 1^a, 47 2^a ferè, post medium noctis, quæ decimum septimum diem Romana consuetudine auspicatur. Vides igitur, quàm propè inter se vtraq; ratio consentiat. Et hætenus quidem dictum sit de ☉. ac quæ ab eius motu pendent. Nunc Lunam aggredimur, & inde cæteros planetas.

XXIIII. PRAECEPTVM DE CALCULO VERI

motus ☾ siue à medio loco ☉. siue à prima stella ♀. siue ab adparenti æquinoctio, quodcunq; tempus datum fuerit.

Ad datum tempus initio hæc inuenienda sunt. Primum vera præcessio æquinoctiorum per 10. præceptum. Deinde æquales motus, Solis quidem simplex, Lunæ verò longitudinis à ☉. & anomalix motus per 8. Præceptum. Inde per duplicem ☾ longitudinem à Sole venaberis Prosthaphæresin secundi Epicycli. vnà cum scrupulis adiacentibus proportionalibus, quæ interea adseruentur. Est autem hæc Prosthaphæresis adiungenda anomalix Lunari antequam duplex longitudo à Sole compleuerit semicirculum, sed post semicirculum auferenda, vt anomalia Lunaris coæquata existat. Iam per hanc coæquatam anomaliam excerpe iustam Prosthaphæ. primi Epicycli cum sequenti excessu, de quo iuxta scrupula proportionalia prius adseruata collige partem congruentem, quæ semper æquationi primi Epicycli adiecta reddit eam absolutam. Hæc autem equali motui longitudinis ☾. auferenda est, antequam anomalia coæquata expleuerit semicirculum, postea verò adiungenda, vt vera Lunæ longitudo à ☉. ad datum tempus numeris cognoscatur.

De emendatione, si gradibus adhæserint scrupula.

Qualis debeat esse legista Astrophilius.

Cæterum hoc perpetuò meminisse volumus studiosum lectorem quoties in vsu alicuius Canonis Prosthaphæ. ipsis sexagenis & gradibus adhæserint scrupula, ipsas æquationes in angulari profelide occurrentes non omninò iustas esse sed prius corrigendas, ita vt penes scrupula proportionalia prius venemur partem congruentem ex adiacente differentia addendam vel subtrahendam, prout æquationes eadem vel crescunt vel decrescunt. Id tamen in ☉. dictum est, tamen lectori hoc loco in memoriam redigere denuò visum est, ne porro eadem cantilena cum fastidio nobis repetenda sit. Omninò enim eos, qui Astronomicum calculum foeliciter subducturi sunt, mediocri ingenij dexteritate præditos esse conuenit. quia in tanta rerum & varietate & tenuitate multa relinquenda sunt iudicio & cogitationi studiosi lectoris, quando alicuius præcepti summa recitatur.

Postremò

Postremo si verg longitudini Δ a medio loco \odot , adieceris motum \odot simplicem, cognosces veram Δ distantiam a prima stella \vee , cui rursus addita vera præcessio æquinoctij, ostendit verum locum Δ ab æquinoctio adparente. Exemplum natalicij temporis inclyti Ducis Borusie vera præcessio æquinoctij supra inuenta est part. 26. scr. 59 1^a, 29 2^a, Motus simplex æqualis \odot est o. sex. 36. part. 54 1^a, 29 2^a, scr. Longitudinis vero Δ æqualis 5. sexag. 36. part. 55 1^a, 49 2^a, scrup. & anomalix eiusdem 5. sex. 52. part. 59 1^a, 11 2^a, scr. Duplex ergo longitudo Δ sex. 5. partium 11. scr. 51 1^a, 38 2^a, (abiectione nimirum integro circulo) supeditat ex Canone Prosthaph. Δ æquationem secundi epicycli partium 10 scr. 21 1^a, 19 2^a, subrahendam ab anomalia, ut fiat coæquata scilicet 5. sexagenarum 42 part. 17 1^a, 52 2^a, scr. simul etiam exhibet scrupula proportionalia 11 1^a, 38 2^a, interim adseruanda. Iam per coæquatam anomaliam colligo æquationem primi epicycli addendam partis 1. scr. 23 1^a, 0 2^a, cum sequenti excessu scr. 40 1^a, 31 2^a, de quo excessu scr. 11 1^a, 38 2^a, competunt scrupula 7 1^a, 51 2^a, quæ adiecta parti vni scr. 23 1^a, 0 2^a, absoluunt equationem primi epicycli partis 1. scr. 30 1^a, 41 2^a. Hæc tandem adiecta æquali motui longitudinis ostendit Lunam verè abesse a medio loco \odot sex. 5. partibus 38. scr. 26 1^a, 50 2^a. Distat autem medius locus, \odot , a prima stella \vee . partibus 36. scr. 54 1^a, 29 2^a. Nam hic est æqualis motus eius simplex Si ergo hæc partes 36. scr. 54 1^a, 29 2^a, adiungantur sexagenis 5. par. 38. scr. 26 1^a, 30 2^a, apparet vera distantia a Δ prima stella \vee . partium 15. scr. 20 1^a, 59 2^a. Huic rursus si adieceris veram præcessionem æquinoctij par. 26. scr. 59 1^a, 29 2^a, emergit vera distantia Δ ab adparenti æquinoctio partium 42. scr. 20 1^a, 28 2^a.

XXV. PRAECEPTVM DE CORRECTIONE MO-

tus Δ . cum ratio motus eius subducta est ad tempus aliquod adparens prius in æqualitatem non commutatum.

Quando ratio motuum subducta est ad datum tempus adparens. *Correctio motus* quod non prius commutatum est in æqualitatem, necesse est aliquam *ob inæ-* adhibere correctionem ob inæqualitatem dierum naturalium, quem *qualitatem* admodum copiose supra in primo præcepto explicatum est. Ea igitur *dierum na-* correctio fiet in hunc modum. ut sanè hic repetamus. quæ supra in *turalium.* ne illius primi præcepti tradita sunt, secundum doctrinam eius præcepti inuenias æquationem dierum naturalium, vel iuxta primum modum vniuersalem, vel secundum particularem, ac vide quantus ei æqualis Δ motus competat, vel quod compendiosum & satis commodum sit, pro binis scrupulis horæ accipito singula scrupula gradus, quæ auferas a vero motu Δ iam inuento, si æquatio dierum fuerit auferenda,

alioquin ea scrupula ei adiunges. Ita enim comparabis verum motum
 congruentem dato tempori apparenti.

EXEMPLVM. Proximè inuentus est verus locus γ à medio lo-
 co \odot . sexag. 5. part. 38. scr. 261^a , 302^a ad datum tempus natalicium
 inclyti Ducis non prius commutatum in æqualitatem. Ad eum verò
 diem natalicium supra in primo præcepto iuxta primum modum in-
 uenta est dierum naturalium æquatio scrupulorum 81^a , 512^a , vnus
 horæ quibus respondent scr. 41^a , 262^a . vnus partis motus γ . At
 quia æquatio ipsa erat auferenda, ideo & hic motus scrupulorum 41^a ,
 262^a , ablatus à sexagenis 5. partibus 38. scr. 261^a , 302^a , ostendit ve-
 rum locum γ . à medio \odot . congruentem rectissime dato tempori, scili-
 cet, sexagenarum 5. part. 38 scr. 221^a , 42^a .

Cæterum supra dictum est de vtroq; Canone particulari æquatio-
 nis dierum naturalium, quòd videlicet vtiliter seruiant circiter annos
 100. vt ab anno Domini 1530. vsq; ad annum 1640. ferè. Item quod
 Canon ex Regiomontani doctrina & recentiorum imitatione compo-
 situs vsurpet peculiare æqualium motuum Epochas, iuxta quas sanè
 ad datum tempus natalicium verus γ motus à medio loco \odot foret re-
 motior scrupulis 41^a , 262^a ferè, quemadmodum etiam hic Canon æ-
 quationis tanto plus ex ipso vero motu γ demere iubet, vt relinquatur
 motus aptè congruens tempori dato adparenti, id quod cuiq; pro sua
 diligentia & industria porro excutiendum, ac examinandum relin-
 quimus.

XXVI. PRÆCEPTVM. AD DATVM TEMPVS

quantum vel à prima stella \vee . vel ab adparenti æquinoctio distet
 in consequentia, tum Boreus limes latitudinis γ . tum nodus
 Lunæ euehens in Aquilonem.

Initiò vocabula explicanda sunt. Moueri in consequentia, est mo-
 veri secundum ordinem dodecatemriorum, vel 12. signorum Zodiaci.
 In præcedentia autem contra seriem signorum vel retrò. Nodi Lunæ
 sunt duæ communes sectiones vtriusq; plani solaris & lunaris. Sicut
 enim planum Zodiaci inclinatum est ad planum Aequinoctialis circuli,
 ita vicissim planum in quo Luna perpetuò versatur, inclinatum est
 ad planum Solare, quod vulgò planum vocant Eclipticæ. Sunt autem
 hæ sectiones ex diametro circuli sibi inuicem oppositæ terra interce-
 dente media, perinde vt puncta inter se vel æquinoctialia, vel solstitia-
 lia. Nodus euehens Græcis $\sigma\omega\delta\epsilon\sigma\mu\odot$ ἀναβιβάζων est illa sectio, ex
 qua Luna discedens attollitur in aquilonem, cuius hic vsitatus chara-
 cter est $\sigma\omega$. Arabes vocant Genzahar, id est, caput Draconis, Nodus de-
 uehens seu deprimens, Græcis $\kappa\alpha\tau\alpha\beta\iota\beta\acute{\alpha}\zeta\omega\mu$ est altera opposita sectio,
 ex qua

$\pi\alpha\pi\tau\delta$ Bo-
 $\gamma\epsilon\iota\delta$ πέρτα-
 $\tau\odot$.
 Nodi.
 $\sigma\omega\delta\epsilon\sigma\mu\odot$.

$\delta\alpha\beta\iota\beta\acute{\alpha}\zeta\omega\mu$
 $\delta\delta$ Euehens

$\kappa\alpha\tau\alpha\beta\iota\beta\acute{\alpha}\zeta\omega\mu$
 $\zeta\omega\mu$

ex qua Luna discedens procumbit in Austrum, nota eius ♂ vulgo ♂ Deuehent
 cauda Draconis dicitur. Boreus limes est medium punctum semicirculi D . Borealis. Australis limes e regione oppositus medium est similiter punctum semicirculi D . Australis. Itaq; inter vtrumq; limitem & ipsos nodos quadrantes circuli comprehenduntur. Nunc præceptum recito. Ad datum tempus inuenias hos æquales motus simplicem \odot . longitudinis D . à \odot . & latitudinis D . Deinde & veram præcessionem verni æquinoctij. Conijce in vnam summam æquales motus, simplicem \odot . & longitudinis D à \odot . vt existat æqualis longitudo D . à prima stella V . Hinc abiectus æqualis motus latitudinis relinquit distantiam Borei limitis à prima stella V . Vnde rursus abiectus quadrans circuli relinquit distantiam nodi euehentis Lunam ab eadem prima stella. Quod si vtriq; harum distantiarum adiunxeris veram præcessionem habebis distantiam ab adparenti æquinoctio, hinc nodi euehentis Lunam, illinc Borei limitis.

Exemplum. Ad datum tempus nostrum æqualis \odot . simplex est sex 0. part. 36 scr. 54. $1^a, 29^a$. Aequalis longitudo D à \odot . sex. 5. part. 36. scr. 55. $1^a, 49^a$. latitudinis deniq; part. 49. scr. 17. $1^a, 59^a$. Vera autem præcessio part. 26. scr. 59. $1^a, 29^a$. Iam simplex motus \odot . & longitudinis D . simul faciunt sexagenas 6. partes 13. scr. 50. $1^a, 18^a$. quæ est distantia medij loci D à prima stella V , sed si ex hac distantia reijciatur motus latitudinis D partium 49. scr. 17. $1^a, 59^a$, relinquitur distantia Borei limitis ab eadem stella sexa. 5. part. 24. scr. 32. $1^a, 19^a$, & abiecto rursus quadrante circuli, vel 90. partib. reliqua fit distantia nodi euehentis Lunam ab eadem stella sex. 3. partib. 54. scr. 32. $1^a, 19^a$. Iam vtrobiq; adiecta vera præcessio ostendit longitudinem ab adparenti æquinoctio, nodi quidem euehentis sexag. 4. part. 21. scr. 51. $1^a, 48^a$. Borei autem limitis sex. 5. part. 51. scr. 51. $1^a, 48^a$.

Aliud exemplum. Ad initium annorum Christi est æqualis motus \odot . simplex sexag. 4. part. 32. scr. 29. $1^a, 52^a$, longitudinis D à \odot . sexag. 3. part. 29. scrup. 58. $1^a, 23^a$, latitudinis D sexag. 2. part. 9. scr. 41. $1^a, 51^a$. Vera præcessio partium 5. scr. 15. $1^a, 55^a$. Distantia ergo medij loci D à prima stella V . est sexag. 2. part. 2. scr. 28. $1^a, 15^a$. Vnde abiectus latitudinis D . motus relinquit distantiam Borei limitis ab eadem stella sexag. 5. part. 52. scr. 46. $1^a, 24^a$. Hinc rursus quadrans circuli remotus relinquit distantiam nodi euehentis ab eadem stella sexag. 4. part. 22. scr. 46. $1^a, 24^a$. Quod si vera præcessio vtrunque adiungatur, exister longitudo ab adparenti æquinoctio nodi quidem euehentis sex. 4. part. 28. scr. 2. $1^a, 19^a$, limites autem Borei sex. 0. part. 15. scr. 2. $1^a, 19^a$.

XXVII. PRAECEPTVM. QVANTVM IN DATO

tempore Boreus limes, aut nodus euehens Lunam moueatur in
præcedentia, vel à medio loco ☉ vel à prima stella ♀. vel
à medio æquinoctio vel etiam ab adparenti
æquinoctio.

Ad datum tempus ex Canonibus æqualium motuum habeas tum
simplicem ☉, tum compositum, item longitudinis ☽ à ☉, & latitudi-
nis eiusdem. Si abstuleris iam motum longitudinis ☽ à motu latitudi-
nis, reliquus fiet motus Borei limitis à medio loco ☉. Si ex hoc ru-
sum abieceris æqualem quidem simplicem ☉, habebis reliquum mo-
tum eiusdem limitis à prima stella ♀, sed motum compositum si re-
moueris inde, erit reliquus motus à medio æquinoctio. Quod verò
de motu Borei limitis dixi, accipiendum similiter est tum de altero Au-
strino limite, tum verò de utroq; nodo Lunæ tam euehente, quam de-
uehente, eo quod hæc puncta semper inter se distant quadrantibus cir-
culorum, & diametri ductæ secant se $\pi\phi\phi\sigma\varsigma\ \delta\epsilon\delta\epsilon\varsigma$, ac Boreum quidem
limitem antecedit in præcedentiā nodus euehens gradibus 90. sicut
hæc traduntur vberius in Elementis. Exemplum subiungo. Volo sci-
re motum diurnum Borei limitis. Diurnus igitur æqualis, solis qui-
dem simplex est part. 0. scr. 59 1^a, 3 1^a, 11 3^a, 12 4^a. Vt reliqua sanè
nunc omittantur, compositus vero par. 0. scr. 59 1^a, 8 2^a, 19 3^a, 37 4^a,
longitudinis ☽ à ☉ Partium 12. scr. 11 1^a, 26 2^a, 41 3^a, 50 4^a, & latitu-
dinis partium 13. scr. 13 1^a, 45 2^a, 39 3^a, 31 4^a. Iam si diurnus longi-
tudinis ☽ auferatur à diurno latitudinis, reliquus fit diurnus Borei
limitis à medio loco ☉ part. 1. scr. 2 1^a, 18 2^a, 58 3^a, 1 4^a. Hinc si pri-
mum abieceris diurnum ☉ simplicem, reliquum facies motum Borei
limitis diurnum à prima stella ♀, par. 0. scr. 3 1^a, 10 2^a, 46 3^a, 39 4^a.
At si abieceris illinc motum ☉ compositum, reliquus erit motus li-
mitis à medio æquinoctio par. 0. scr. 7 1^a, 10 2^a, 38 3^a, 24 4^a. Atq; hæc,
vt dixi, similiter accipienda sunt & de Austrino limite, & de utroq;
nodo, eo quod hæc 4. puncta iisdem semper ac quidem æqualibus
interuallis disiuncta circumferuntur. Ad eundem modum ratiocina-
beris motum 70. dierum vel anni, vnus aut plurium.

*Borei limitis
integra perio-
dus in præce-
dentia.*

Ac vt obiter hoc quoq; adijciam, motus Borei limitis in præceden-
tia absoluit integrum circuitum, ad stellas quidem fixas diebus 6793-
horis, ferè 6. sed ad medium æquinoctium diebus 6798. horis ferè 4.
nimirum aliquanto tardius, propterea quod & medium æquinoctium
à prima ♀. stella in præcedentia remouetur. Caterum si integrum cir-
culum vel 6. sexagenas partium distribueris in motum diurnum æ-
qualem quemcumq;, venaberis tempus periodicū seu $\alpha\pi\kappa\alpha\tau\alpha\varsigma\ \alpha\iota\iota\kappa\omicron\varsigma$
eiusdem

eiusdem motus constans ex diebus & eorum tum scrupulis, tum fortasse etiam sexagenis, cuius rei nonnulla exempla exhibuimus tibi in logistice nostra scrupulorum Astronomicorum.

Quod si scire voles quantum in dato tempore Boreus limes moueatur ab adparente æquinoctio in præcedentia, primum quærito ad initium illius temporis distantiam Borei limitis ab eodem æquinoctio in consequentia iuxta antecedens præceptum, deinde similiter ad finem eiusdem temporis. Hac posteriori distantia ablata à priori, relinquetur regressus Borei limitis ab adparenti æquinoctio velut in præcedentia. Exempli gratia, libeat scire quantum ab initio annorum Christi Boreus limes circuli Lunaris regressus sit ab adparenti æquinoctio usque ad datum tempus natalicium. Per præcedens igitur præceptum ad initium annorum Christi inuenta est distantia Borei limitis ab adparenti æquinoctio in consequentia sex. 0. part. 15. scr. 2 1^a, 19 2^a. Sed ad natalicium tempus inclyti Ducis sex. 5. part. 51. scr. 3 1^a, 48 2^a. Hac posteriori distantia ablata à priori reliquus sit motus Borei limitis ab adparenti æquinoctio in præcedentia sex. 0. part. 23. scr. 30 1^a, 3 1^a. Videlicet præter integros circulos, si quidem intra annos nouenos de nos circuitum vnum absoluit.

XXVIII. PRÆCEPTVM. DE CALCULO VERI motus latitudinis D à Boreo limite.

Ad datum tempus inuenias æqualem motum latitudinis D, quem Copernicus Ptolomei imitatione non à nodo euehente, vt sit in Alphonfino abaco, sed à Boreo limite deducit. Deinde habeas & absolutam primi epicyli D Prosthaphæresin, quam vt in 24. præcepto factum est, auferes à motu latitudinis, si coæquata anomalia minor fuerit semicirculo, vel adiunge eidem, si maior. Ita enim conficies verum motum latitudinis D, vt à Boreo limite in consequentia. Huic verò motui adiectus quadrans circuli, eum arcum quem in Alphonfino calculo nominant argumentum latitudinis, vt à nodo euehente, vel capite Draconis, vt vocant deductum, quod obiter monendum censui. Exemplum ad datum tempus natalicium medius latitudinis D motus inuentus est sex. 0. part. 49. scr. 17 1^a, 59 2^a, & Prosthaphæresin primi Epicycli absoluta per 24. præceptum part. 1. scr. 30 1^a, 41 2^a, addenda, eò quod coæquata anomalia D maior est semicirculo. Verus igitur motus latitudinis, est sex. 0. part. 50. scr. 48 1^a, 40 2^a. Per hunc arcum veri motus latitudinis à Boreo limite ratiocinamur veram Lunæ latitudinem ab Ecliptica vel, vt Ptolomæus loquitur, à circulo, qui per medium Zodiacum describitur.

XXIX. PRAECEPTVM. DE CALCULO VERAE latitudinis D.

Quando verus motus latitudinis D vel nihil est, vel integer semicirculus, latitudo D maxima existit, nempe. s. graduum, borealis quidem quando nihil est motus ille latitudinis, australis verò. quando semicirculus, sed ubi doctanti exæquatur, Luna omnino expers est latitudinis tenetq; nodum euehentem, unde paulatim adsurgit in Aquilonem, ubi verò quadranti exæquatur, Luna similiter caret latitudine tenetq; nodum deuehentem. Unde a plano Solari sensim declinat in austrum, quemadmodum etiam ex Canone latitudinis D. hæc comparent. Scandit itaq; Luna latitudinem ab Austrino limite in Boreum & ab hoc rursus descendit in Austrum.

*Duo Canones
latitudinis D.*

Habes autem duos Canones latitudinis D. alterum totalem, qui procedit per singulos gradus totius circuli, & vniuersaliter seruit inuentioni latitudinis ipsius. Alterum verò partialem, qui propriè aptatus est Eccliptici: duorum luminum syzygijs & per dena scrupula paucarum tantum partium circuli Lunaris circa nodos ex utraq; parte ingredit. Vtiusq; igitur vsum exemplo ostendam.

Ac vt ad datum quodcunq; tempus veram colligas Lunæ latitudinem, per præcedens præceptum inuentum habes verum motum latitudinis cum eoq; ingreditur Canonem latitudinis D. adhibita correctione, de qua nunc sæpe dictum est. Ita enim faciliè veram latitudinem D. venaberis. Addo exemplum, vt præceptum rectius intelligatur. Ad datum igitur tempus nostrum inuentus est verus motus latitudinis sex. o. par. 50. scr. 48. 1^a, 40. 2^a, id est, dodecatemorii vnius part. 20. scr. 48. 1^a, 40. 2^a, Ingressus igitur Canonem cum vno dodecatemorio & 20. partibus reperio latitudinem borealem Luna iam descendente partium 3. scr. 12. 1^a, 42. 2^a, at 2. partibus congruit latitudo partium 3. scr. 8. 1^a, 39. 2^a. Cum igitur intervallo vnius gradus latitudo decreseat scrupulis 4. 1^a, 3. 2^a, erit iuxta vsitatam doctrinam pars congruens scrupulis 48. 1^a, 40. 2^a, scrupulorum 3. 1^a, 16. 2^a, quæ ablata ex partibus 3. scr. 12. 1^a, 42. 2^a, relinquunt veram Lunæ latitudinem boream quidem partium 3. scrup. 9. 1^a, 26. 2^a, verum eadem iam paulatim descendente versus meridiem.

Nec dissimilis ratio est alterius Canonis, nisi quòd partem congruentem iuxta decem tantum scrupula venari nunc oportet. Vt sit verus motus latitudinis D. dodecatem 2. part. 29. scr. 44. 1^a, 14. 2^a. Ingressus igitur Canonem latitudinis D. in Eclipsibus offendo 2. dodecatemorio in imo Canonis, & ascendendo 29. gr. cum scr. 40. ad sinistram intra aream Canonis. Excerpo itaq; scriptam e regione latitudinem boream

boream gr. o. scr. $11^a, 44^a 2^a$, ac quia per dena vnus gradus scrupula proxima decrefcit latitudo borea scrupulis $52^a 2^a$, debentur ἀναλογικῶς scrupulis reliquis $41^a, 14^a 2^a$, scrupula $22^a 2^a$, abijcienda. Vera igitur latitudo est partis o. scr. $11^a, 22^a 2^a$, Id est, paululum adhuc abest à nodo deuchente, quem vulgus caput Draconis vocat.

XXX. PRAECEPTVM DE CALCULO DIURNI

motus ad datum tempus à prima stella ♀. vel ab adparenti æquinoctio.

Luna præ ceteris planetis omnibus & plurimum vno die mouetur πρὸς τὴν μέν. & subito variat cursum suum. Vt enim noua & plena, quando occyssi. πρὸς τὴν κινῆ. me currit, minus cietur quàm dimidiata, ita e contra, quando noua ματος ἢ δρό. vel plena omnium tardissima est, plus tamen conficit spacij quàm dimidiata temporibus vbiq; æqualibus: ita in singulis mensibus huiusce varietatis vicissitudines absoluat: uerùm aliàs aliter, quia nec noua, nec plena, nec dimidiata easdem semper primi Epicycli partes occupat, sed eadem vel simili mensis parte modò hunc, modò alium situm nanciscitur. Sed recito præceptum. Ad dati igitur diei meridiem siue aliam eius horam quamcunq; inquiras verum Lunę motum à medio loco ☉. Inde similiter vel ad antecedentis vel, sequentis diei meridiem aut consimilem horam. Aufer motum Prioris diei à posteriori. Reliquus enim fiet motus verus diarius à medio loco ☉. cui si adieceris æqualem ☉ simplicem diurnum. conflabitur verus diarius vel à prima stella asterisimi Arietis, vel ab æquinoctio adparente, id quod in præsentia in nullo ponendum est discrimine, eò quòd adparens æquinoctium intra 7. vel 8. dies vix vno secundo scrupulo mutetur. Vt ad nataliciam horam inclyti Ducis Borussię æqualis motus longitudinis à ☉ est sexagen. 5. part. 36. scrup. $55^a 1^a, 49^a 2^a$, & anomalie sexag. 5. part. 52. scr. $39^a 1^a, 11^a 2^a$, per quę colligitur iuxta doctrinam 24. præcepti verus diarius motus à medio loco ☉ sex. 5. part. 38. scr. $26^a 1^a, 30^a 2^a$. Ad sequentem verò diem 18. Maij adiectis motibus diurnis æqualibus constat æqualis motus longitud. di sexag. 5. part. 49. scrup. $71^a, 16^a 2^a$. Anomalie verò sexa. 0. part. 5. scr. $43^a 1^a, 5^a 2^a$, per quę verus diarius motus à medio loco ☉ colligitur sex. 5. part. 49. scr. $71^a, 12^a 2^a$. Iam Prioris diei motu ablato ab hoc posteriori relinquitur motus diarius à medio ☉ partium 10. scrup. $40^a 1^a, 42^a 2^a$, cui adiectus motus diurnus ☉ simplex constituit integrum motum diurnum diei à prima stella ♀ partium 11. scrup. $39^a 1^a, 50^a 2^a$. Meminerit autem logista pro antecedente die subtrahendos esse æquales motus à prioribus.

Postremò Luna nec regressum patitur, nec stationem, sed aliàs velox dicitur, aliàs tarda. Velox, cum motus verus diarius superat mo-

tum æqualem longitudinis, quod fit per inferiorem semicirculum. & maxime circa perigeon primi Epicycli. Tarda verò, cum diarius adparens minor est eodem æquali motu longitudinis, id quod accidit ei versanti in superiori semicirculo, & maxime circa apogeon primi epicycli, Nam circa longitudines eiusdem medias verus & æqualis motus propemodum inter se exæquantur. Est autem æqualis motus longitudinis Δ diurnus à \odot part. 12. scr. 11 1^a, 27 2^a. Sed à prima stella \vee . par. 13. scr. 10 1^a, 35 2^a.

XXXI. PRAECEPTVM. DE CALCULO

motus Δ horarij.

πρὸ τῶ ὧρ
αἰς κινῆμα
505.

Ad datum tempus primum reperias motum Δ diurnum à prima stella \vee . Inde adhibeas Canonem vicesimæ quartæ, vt supra in 19, præcepto traditum est. Veluti ad datum tempus inuentus est per præcedens præceptum verus Lunæ motus diarius part. 11. scrup. 39 1^a, 50 2^a, à prima stella \vee . Iam primum ex Canone vicesima quarta pars 11. graduum est scrupulorum 27 1^a, 30 2^a, similiter 24. scrupulorum 39. 1^a est scrupulorum 1 1^a, 37 2^a, 30 3^a, deniq; scrupulorum 50 2^a, vicesima quarta est scrupulorum 2 1^a, 5 3^a. Hæc singula suo ordine collecta in vnam summam ostendunt motum horarium Δ ad Natalicium diem inclyti Ducis Borussiae, scrupulorum 29 1^a, 0 2^a, ferè. Nam tertia non iniuria negliguntur. Cæterum aliquanto post in calculo Eclipsium rursus dicendum erit de motu tum \odot , tum Δ horatio.

XXXII. PRAECEPTVM. DE RATIONE NUMERANDI

parallaxin \odot & Δ in circulo altitudinis ad quodcunq; tempus, si prius distantia luminis à vertice fuerit data.

πρὸ τῶ πα-
ρὰ ἀόρεως τῆ
ἐλπίδος.

Circulus altitudinis est maximus circulus, qui per verticem capit is describitur. Etsi autem paulo post in doctrina Eclipsium Solis multa nobis dicenda erunt de parallaxi vtriusq; luminis, tamen hic generale præceptum proponendum est, quomodo Parallaxis Lunæ etiam non nouæ vocanda sit ad calculum, quod in motuum obseruatione nequaquam ignorari oportet. Verum vt sequentia reclus simul & commodius tradi queant, partes generalis Canonis parallaxeon \odot & Δ in circulo altitudinis prius explicandæ sunt. Ac tres priores ordines satis noti sunt ex suis titulis. Quartus verò ordo est defectus, quo parallaxis apogea Lunæ diuiduæ minor est parallaxi apogea Lunæ nouæ aut plenæ. Quinto loco sequitur illa paral. apogea nouæ Lunæ aut plenæ. Sextus ordo habet parallax. perigeam Lunæ nouæ aut plenæ. Septimus verò continet excessum, quo parall. perigea Lunæ diuiduæ superat perigeam Lunæ nouæ aut plenæ, quæ parallaxis sexto loco proximè antecedit. Octauus ordo habet scrupula proportiona-

lia.

lia, quæ seruiunt minori Epicyclo. siue duplicatæ distantia Δ à \odot .
Vltimus verò scrupula itidem proportionalia accommodata maiori
Epicyclo, siue anomalie Lunæ.

Ad datum igitur tempus habeas ex doctrina præcepti 24. & medi-
um motum longitudinis Δ à \odot . & anomaliam eius coequatam. Di-
stantiam verò Lunæ à vertice aliunde datam esse oportet, vt vel ex do-
ctrina Sphæricorum triangulorum, vel ex Canone aliquo primi mo-
bilis. His ita datis per duplicem Lunæ distantiam à vertice capias pa-
rallaxin Δ in quatuor suis limitibus. Videlicet, ex quarto, quinto,
sexto ac septimo ordinibus. Similiter per duplicem Δ à \odot longitudi-
nem scrupula proportionalia priora vel minori epicyclo destinata
iuxta quæ accipiemus de vtroq; excessu primi & vltimi limitis partes
congruentes ad 60. quarum priorem à proximè sequenti parallaxi
quinti ordinis semper auferemus, posteriorem autem ei, quæ in pe-
nultimo limite velut sexto ordine contra addemus. Ita enim parallax-
es Δ binas emendatas in apogeo & perigeo habebimus. quas epicy-
clus minor, vel duplex Δ à \odot distantia auget vel minuit. Postea cum
anomaliam lunari capiemus vltima scrupula proportionum, quibus è
differentia parallaxium proximè inuentarum sumemus etiam partem
congruentem, quam semper adijciemus parallaxi emendatæ priori,
quæ apogeo debetur. Ita tandem absoluta prodibit parallaxis loco
 Δ . & tempori aptè congruens. Exemplo fiet præceptum hoc illustrius.
Ad datum tempus natalicium inclyti Ducis Borussie medius Lunæ
motus à \odot partium est 336. scrup. 56, 1^a, ferè, & anomalia coequata
part. 342. scrup. 18, 1^a, & distantia à vertice graduum ferè 31. vt in Ho-
rizonte Onolspachienfi. Per duplicem igitur distantiam à vertice par-
tium 62. ex Canone colliguntur primum defectus primi limitis à se-
cundo scrupulorum 11, 1^a, 11, 2^a. deinde parallaxis 2. limitis scrup.
27, 1^a, 38, 2^a. deinde parallaxis tertij limitis scr. 32, 1^a, 55, 2^a, ac tandem
excessus tertij & quarti scr. 11, 1^a, 49, 2^a. Motus Δ à \odot duplex constat
part. 313. scr. 52, 1^a. quibus respondent scr. proportionum priora 9, 1^a,
28, 2^a, quibus rursus de scrup. 11, 1^a, 11, 2^a, congruunt scrupula 11, 2^a.
auferenda à paral. secundi limitis scr. 27, 1^a, 38, 2^a. Emendata igitur pa-
ral. apogea est scr. 27, 1^a, 27, 2^a. Rursus iisdem scr. proportional, 9, 1^a,
28, 2^a, congruunt de posteriori excessu scr. 11, 1^a, 49, 2^a, scr. 16, 2^a, adij-
cienda tertio limiti vt sit emendata paral. perigea scr. 33, 1^a, 12, 2^a. Ideo
vtriusq; emendatæ parallaxeos differentia scrupulorum 5, 1^a, 45, 2^a.
Tandem part. anomalie coequatæ 342. scr. 18, 1^a, debentur ex cano-
ne in extremo ordine scrupula proportionum 11, 1^a, 16, 2^a, per quas venor
è differentia proxima scr. 5, 1^a, 15, 2^a, partem congruentem scrup. 7, 2^a.

L 2

quæ

quæ adiecta emendatæ parallaxi apogee ser. 27 1^a, 27 2^a, ostendunt absolutam D. parallax in scrup. 27 1^a, 34 2^a, quam quærebamus.

Similiter & per distantiam ☉ à vertice duplicatam capies parallaxin Solis ex tertio ordine, quæ mox emendata est, ac penitus absoluta.

Ceterum Parallaxes ☉ & D. vniuersaliter quidem præcumbunt versus Horizontem, vt ad parens locus Horizonti, verus autem vertici capitis sit propior, At in nostris climatis borealibus tantum in Austrum nunquam verò in Boream.

Vide autem, bone lector, integrum calculum huius negotij

XXXIII. PRAECEPTVM. IN QVIBVS ZODIA-

ci locis hæreant Apogea quinq; errantium stellarum

☿ ♀ & ♄ ad datum tempus.

πρὶ τῶν πέντε
πλανη-
τῶν.

Hactenus de calculo motus ☉ & D, quæ stellæ Græcis φῶτα dicuntur, Latinis lumina, seorsim tradita sunt præcepta. Deinceps reliquas quinq; erraticas stellas, quas Græci propriè vocant planetas, simul complectemur. Ac vt primum constet apogei locus, cuiusq; horum quinq; ad datum tempus ex Canone equalium motuum iuxta doctrinam, 8. præcepti collige motum apogei, quemadmodum singuli, vt suas Epochas loci apogei ita & Canones proprio huius motus habent, præter Venerem Conflati enim motus ostendent quantum cuiusq; apogeon

apogeon absistat à stella asterismi Δ . At Veneris apogeon semper eundem locum sub sphaera fixarum obtinet ac distat inde perpetuo iuxta Copernici observationes & Hypotheses partib. 48. scr. 21 1^a. Quod si locis singulorum apogeorum à prima Ψ adieceris veram præcessionem æquinoctij, exhibunt eorundem apogeorum ab adparenti æquinoctio distantia dato tempore convenientes. Ut ad Natalicium diem In-clyti Ducis Borussiae colligitur Saturni quidem locus seu distantia apogei à prima stella Ψ sex. 4. part. 0. scr. 11 1^a, 12 2^a, 24 sex. 2. part. 38. scr. 24 1^a, 48 2^a, 57 sex. 1. part. 59. scr. 39 1^a, 31 2^a, 5 deniq; sexa. 3. part. 30 scr. 31 1^a, 40 2^a. Nam Veneris semper est sexag. 0. part. 48. scr. 21 1^a, ut dixi. Est autem vera æquinoctij præcessio eodem tempore part. 26. serup. 59 1^a, 29 2^a, quæ adiecta singulorum locis ostendit eo tempore abfuisse ab adparenti æquinoctio in consequentia Θ quidem apogeon partib. 267 scr. 10 1^a, 41 2^a, 24 partib. 185. scr. 24 1^a, 17 2^a, 57 partib. 146. scr. 39 1^a, 0 2^a, 7 partibus 75. scr. 20 1^a, 29 2^a, 5 deniq; partib. 237. scr. 31 1^a, 9 2^a. Itaq; apogeon Θ hærebat in 28. parte Γ . 4 in 6. parte Δ , 57 in 27. parte Δ , 5 in 16. parte Π , 5 in 28. parte μ . Perigea autem Eccentricorum semper possident loca apogeis directe ac per centrum opposita.

XXXIII. PRÆCEPTVM, DE CALCULO VERI MO-

tus earundem quinq; Erraticarum.

Duplicem huius Calculi formam trademus, alteram Ptolemaicam $\epsilon\pi\lambda\omicron\gamma\iota\sigma\mu\omicron\varsigma$ alteram propriam Copernici, quæ tamen in solis tribus superioribus $\delta\psi\kappa\phi\omicron\phi\omicron\varsigma$ planetis Θ , Ψ & Γ , locum habet. Verum ut sequentis præcepti cur-
sus sit expeditior, hoc primum monendus est noster logista, in tribus $\alpha\varsigma\tau\omega\rho\pi\acute{\epsilon}\nu$
superioribus planetis æquales motus longitudinis & anomalix, am-
bos simul adæquari æquali \odot simplici. Venerem autem & Ψ æqua-
lem motum longitudinis communem habere cum \odot . Ex quo intelli-
gitur, in tribus superioribus non opus esse, ut ad datum tempus præ-
ter æqualem motum \odot uterq; motus tam longitudinis, quam anoma-
lix colligatur, sed satis esse alterum eorum inquire, quod hic demptus
ex Solari motu relinquat alterum, ut mox exemplo docebimus. Ve-
runtamen ad Ptolomæi imitationem dedimus etiam Canonem æqua-
lis motus longitudinis in tribus superioribus. Suprà autem dictum
est, æquales motus longitudinis deducere nos à prima stella Ψ . Ano-
malix verò, quem Copernicus Parallaxeos, seu commutationis vocat
iuxta suas Hypotheses, initium sumit ab æquali apogeo.

Iuxta Ptolemaicum igitur modum accipe ad datum tempus ex Ca-
nonibus æqualium motuum primum æqualem \odot simplicem & æqua-
lem commutationis Planetæ, qui ablatus ab æquali \odot simplici relin-

*Duplex for-
ma huius
Calculi.*

*Anomalia
commutationis.*

I.
*FORMA
PTOLE-
MITICÆ.*

quit æqualem motum longitudinis planetæ. Vel si vnus tantum horum s. planetarum motus calculum velis subducere, proximum erit pro ipso simplici ☉ accipere motum longitudinis. Sit etiam inuentus apogei locus à prima stella ♀ per præcedentem, & vera præcessio verni æquinoctij. Postea aufer apogei locum ab equali motu longitudinis, vt relinquatur anomalia Eccentri, per quam venaberis ex Canone Prosthaphæreseon eiusdem planetæ. & æquationem Eccentri & scrupula proportionum facta emendatione, si opus fuerit. Hæc Eccentri æquatio afferenda est tum anomalie Eccentri, tum medio longitudinis, quando ipsa Eccentri anomalia minor fuerit semicirculo: sed post semicirculum addenda est, vt vtrunq; coæquetur, quemadmodum ipsi quoq; tituli adscripti huic ordini æquationum per se indicant. At eadem æquatio contrario modo vel addenda est, vel auferenda æquali motui commutationis, vt & hæc anomalia fiat coæquata. Interea scrupula proportionum adseruentur. Iam cum hac coæquata anomalia commutationis ingressus eundem Canonem Prosthaphæreseon ritè excerpas æquationem parallaxeos orbis cum excessu sequenti, è quo iuxta scrupula proportionalia sumas partem congruentem semper addendam parallaxi orbis, vt existat absoluta quæ quidem ante semicirculum coæquatae anomalie commutationis semper addenda est, post verò subtrahenda.

*Coequatus
motus longi-
tudinis.*

Hinc iam duplici via ad exitum calculi peruenire licet. Primum enim absoluta æquatio addita vel ablata coæquato motui longitudinis, quem vocant verum Epicycli motum, ostendit veram planetæ distantiam à prima stella ♀, cui tandem adiecta vera præcessio verni æquinoctij monstrat eiusdem locum, ab adparenti æquinoctio, vt non ignorari queat pars dodecatemorij, in quo stella pro eo tempore versatur.

Rursus verò eadem æquatio addita vel ablata coæquatae anomalie Eccentri monstrat verum locum planetæ ab apogeo Eccentri, cui si rursus adieceris verum apogei locum ab adparenti æquinoctio notum ex præcedenti præcepto, habebis eundem, quem prius, verum stellæ locum à verno æquinoctio.

Sed lucem adferet huic præcepto vel vnicum Exemplum. Vt ad datum tempus natalicium inclyti Ducis Borussiae æqualis motus ☉ simplex est sexag. 0. part. 36. scrup. 54 1^a, 29 2^a, Aequalis commutationis motus ☿ sexagenarum 2. part. 8. scrup. 20 1^a, 42 2^a, qui ablati ex æquali ☉ simplici relinquit æqualem longitudinis ☿ motum sexag. 4. part. 28. scrup. 33 1^a, 47 2^a, vt à prima stella ♀. Est & apogei ☿ locus itidem sexag. 4. part. 0. scrup. 11 1^a, 12 2^a, qui reiectus ex motu longitudinis reliquam facit anomaliæ Eccentri sexag. 0. part. 28. scrup. 22 1^a, 35 2^a.

35 2^a, per quam ex Canone Prosthaphæreseon B deprehendo $\pi\theta\phi\theta\sigma\tau\phi$ Eccentri partium 2. scr. 57 1^a, 3 2^a, in hunc modum. Ingredi-
enti Canonem cum 0. sexag. part. 28. obijciuntur part. 2. scr. 54 1^a,
53 2^a, cum differentia descendenti scr. 5 1^a, 47 2^a. Nam quia 0. sexag.
in capite Canonis scripta est, sumi debet differentia descendens. Alio-
qui sumeretur differentia ascendens, si sexagenæ anomalie Eccentri
adscriptæ essent imæ parti Canonis. Iam scrupulis 22 1^a, 35 2^a, quæ
adhærent 28. part. anomalie congruunt de scrupulis 5 1^a, 47 2^a, scru-
pula 2 1^a, 10 2^a, quæ adiecta par. 2. scr. 54 1^a, 53 2^a, eò quod æquatio
adhuc crescit, constituunt emendatam æquationem Eccentri partium
2. scr. 57 1^a, 3 2^a. Similiter inuenies scrupula proportionalia 2 1^a,
34 1^a, quæ interea adseruentur. At Eccentri æquatio ablata anomalie
Eccentri tum motui longitudinis, addita vero anomalie commuta-
tionis, quia ipsa Eccentri anomalia minor est semicirculo, efficit coæ-
quatam anomaliam Eccentri sex. 0. part. 25. scr. 25 1^a, 32 2^a, similiter
motum longitudinis sex. 4. part. 25. scr. 36 1^a, 44 2^a. Anomaliam deni-
q; commutationis sexag. 2. part. 11. scr. 17 1^a, 45 2^a. Per hanc rur-
sum ex eodem Canone Prosthaphæreseon accipio æquationem qui-
dem orbis emendatam part. 4. scr. 45 1^a, 29 2^a, addendam, eò quod a-
nomalia commutationis semicirculum nondum compleuit. Excessum
verò scrupulorum 37 1^a, 5 2^a, de quo pars congruens scrupulis pro-
portionalibus 2 1^a, 34 2^a, est scrup. 1 1^a, 35 2^a, addenda emendatæ
Prosthaphæresi orbis, ut fiat iam absoluta part. 4. scr. 47 1^a, 42 2^a, quæ
addita coæquato motui longitudinis ostendit veram planetæ distan-
tiam à prima stella V sexag. 4. par. 30. scr. 23 1^a, 48 2^a. & addita vera
præcessionis distantiam ab æquinoctio adparenti sexag. 4. part. 57. scr.
23 1^a, 17 2^a.

Eodem peruenies hac via. Absoluta Prosthaphæresis orbis rursus
addita anomalie coæquate ostendit veram stellæ longitudinem ab apo-
geo eccentri sex. 0. par. 30. scr. 12 1^a, 36 2^a. Ipsum verò apogeon abest à
verno æquinoctio in consequentia sex. 4. par. 27. scr. 10 1^a, 41 2^a. quæ
adiecta proximis numeris ostendunt similiter, ut prius, B stellam abesse
ab adparenti æquinoctio verno sexagenis 4. part. 57. scr. 23 1^a, 17 2^a.

Poteris etiam hac vi ratione, ut motum æqualem longitudinis re-
linquas inæquatam tantisper, donec inuenta fuerit & altera Prosthaphæ-
resis orbis scilicet. Postea si utraq; Prosthaphæresis eccentri fuerit eius-
dem qualitatis seu adfectionis, adde inuicem, & summam hanc adde
vel aufer motui longitudinis, prout ambe equationes fuerint vel ad-
dendæ, vel subtrahendæ. Sed si fuerint diuersæ adfectionis, minorem
Prosthaphæresin aufer à maiori, & reliquum adde vel aufer, secundum
maioris

2.
FORMA
COPERNICI.

maioris Prosthaphæreseos proprietatem adiectiuam vel ablatiuam. Ita enim comparabis verum locum Planetæ à prima stella V. Quod monuisse satis est.

Recito nunc & Copernici formam, si quis ea uti malit, etsi tantum in tribus superioribus locum habet. Ac initium quidem Calculi idem est in utraq; forma. Ablato enim motu anomalie commutationis ab æquali Solis simplici, relinquitur motus longitudinis æqualis à prima stella Arietis, & ab hoc rursus ablato loco apogei, reliqua fit anomalia eccentrici, per quam inuenta, ut prius, Prosthaphæresis eccentrici addatur vel auferatur anomalie commutationis, ut fiat coæquata. Cuius & scrupulorum proportionalium adminiculo rursus venaberis absolutam Prosthaphæresin orbis. Hactenus omnia conueniunt. Sed nunc vide dissimilitudinem, Hanc absolutam Prosthaphæresin orbis aufer ipse anomalie commutationis, dum minor est semicirculo, vel adde, dum maior est, ita enim conflatur vera, distantia stellæ à loco ☉. media in præcedentia, vel contra signorum ordinem: quam distantiam, ubi abstuleris ex medio motu ☉ simplici, relinquitur verus planetæ locus à prima stella V. cui adiecta vera præcessio calculum absoluit, ut prius. Quare ut finem tantum præcedentis calculi repetamus, per coæquatam anomaliam commutationis sexag. 2. par. 11. scr. 17 1^a, 45 2^a. existit, ut prius absoluta orbis Prosthaphæresis part. 4. scr. 47 1^a, 4 2^a, quæ iuxta Copernici ἐπιλογισμὸν subtrahenda est ab eadem coæquata anomalia commutationis, eò quod semicirculo minor est. Distantia igitur vera planetæ à medio loco ☉, sed in præcedentia est sex. 2. par. 6. scr. 30 1^a, 41 2^a, quæ ablata rursus à medio motu ☉ simplici sexag. 0. par. 36. scrup. 54 1^a, 29 2^a. relinquit veram distantiam planetæ à prima V. sexag. 4. part. 30. scrup. 23 1^a, 48 2^a, ut prius. Et hactenus tantum Copernici forma differt à Ptolemaica, qua similiter uti licebit in Ζ & ♂, non item in ♀ & ♄.

Cæterum Calculum motus, seu ut Græci loquuntur, ἐπιλογισμὸν ἡμερολογίας omnium planetarum ad datum tempus inclyti Ducis Borussia in tabella spectandum proposui, ne in hac quoq; parte discentium studijs deesset noster conatus.

XXXV. PRAECEPTVM. DE CALCULO VERI
motus diarij alicuius horum 5. Planetarum.

Non est dissimilis forma ab ea, quam supra in sole ac Luna vsurpauimus. Duntaxat igitur exemplum hic requiri potest, quod superiora reuocet in memoriam. Ad horam igitur nataliciam inclyti Ducis verus motus ♂, est à prima stella V. sex. 0. part. 10. scrup. 35 1^a, 28 2^a.

πρὸς ἡμῶν
στὴν κινήμα
τῶν.

28 2^a. Similiter intervallo vnus diei vel 24. horarum post colligitur
 verus motus ♂ iidem sex. o. par. 11. scr. 19 1^a, 49 2^a. Est autem mo- *Planeta*

 rius, scilicet scrupulorum 44 1^a, 21 2^a, quantum stella diurno spacio *κὼς προgre-*
 tunc ferebatur in consequentia. Accidit autem in hoc calculo motum *diens. Dire-*
 posterioris diei alias æqualem esse motui prioris diei, concurrentibus *ctus.*
 contrarijs motibus inuicem æquatis. Ac dicitur planeta stationalis, alias *Στασις.*
 verò minorem motu prioris diei, ac stella in Zodiaco regreditur in pri- *Stationalis.*
 ora, à quibus nimirum discesserat, id quod fit circa perigeo epicycli. Ac in *προχωρῶν.*
 tribus superioribus planetis, cum diametro Solis loco appropinquant. *Retrogadus.*
 In ♀ autem & ♄, cum vespertini occultari, radijsq; solaribus immergi
 propemodum incipiunt. *Regrediens.*

Cæterum ex motu diario ratiocinaberis horarium, vt in ☉ & ☿
 dedisti auxilio canonis vicesimi quarti.

XXXVI. PRÆCEPTVM DE COMPOSITIONE

Canonis veri motus diarij alicuius horum quinq;

Initiò sciendum est, adparentem motum diarium Planetæ ex dua-
 bus velut partibus coagmentari, quarum altera est verus motus epicy-
 cli, quem Copernicus alias terræ, alias visum motum seu celeritatem
 nominat, altera pars est verus motus, quo propriè cietur planeta, vt
 in circumferentiâ epicycli iuxta vîsitatâ Ptolomæi hypotheses. Verus
 quidem epicycli motus perpetuò proceperit in consequentia, tamen in
 æqualiter. Verus autem planetæ cursus non tantum inæqualis est, ve-
 rum in qualibet anomalie periodo seu integra conuersione valde sui
 dissimilis, quia motui epicycli alias addit, alias demit, alias superatur.
 alias verò superat, vt cum planeta est *προχωρῶν*, vel, vt Latini vocant,
 retrogradus.

Ac verus quidem epicycli motus simili ratione calculi cernitur, qua- *Verus Epicy-*
 lem supra in Sole tradidi. Nouo igitur præcepto nihil opus est, sed ta- *cli motus.*
 men exempla nolo hic à studioso desiderari: quæ rursus tria propo- *Tria exem-*
 nam, cum videlicet centrum epicycli ♂ vel transit per apogeon Eccen- *pla.*
 tri, vel cum coæquata anomalia est partium 50. vel partium 150. Mo-
 tus autem æqualis longitudinis ♂ diarius est scr. 51 1^a, 26 2^a, 51 3^a,
 cuius dimidium scr. 15 1^a, 43 2^a ferè.

Iam in apogeo eccentrici scrupulis 15 1^a, 43 2^a, coæquata anomaliæ
 emendata Prosthaph. eccentrici respondet scrupulorum 20 1^a, 48 2^a, auf-
 ferenda, cum in eccentrici apogeo motus centri epicycli sit lentissimus. Itaq;
 semidiurnus verus erit scrupulorum 12 1^a, 55 2^a, diurnusq; scr. 25 1^a,
 50 2^a, in apogeo eccentrici. At in perigeo rursus similis æquatio adden-
 da est æquali motui longitudinis.

M

Rursum

21

Rursum vt habeas verum motum diarium epicycli, cum anomalia eccentrici coequata, id est, distantia centri epicycli ab apogeo eccentrici habet partes 50. primum emendata calculi ratio docet coequatæ anomalie partium 49. scr. 44 1^a, 17 2^a, deberi eccentrici æquationem part. 7. scr. 59 1^a, 28 2^a. Similiter coequatæ anomalie part. 50. scr. 15 1^a, 43 2^a æquationem part. 8. scr. 3 1^a, 24 2^a. vtramq; sanè auferendam. Et quia posterior maior est priori, differentia vtriusq; æquationis scr. 3 1^a, 56 2^a, reiecta ex motu diurno longitudinis æquali, relinquit verum diarium epicycli ad hunc positum scrupulorum 27 1^a, 30 2^a ferè.

3.

Postremo anomalie coequatæ eccentrici partium quidem 149. scr. 44 1^a, 17 2^a, debetur Prosthaph. orbis part. 6. scr. 7 1^a, 17 2^a. At partium 150. scr. 15 1^a, 43 2^a, debetur æquatio partium 6. scr. 1 1^a, 44 2^a, cumq; vtraq; sit auferenda, & posterior à priori superetur, Ideo æquationis vtriusq; differentia iam adijcienda est æquali motui diurno. vt existat verus diarius scr. 36 1^a, 59 2^a, 31 3^a, vel plenè scr. 37 1^a, 0 2^a, dum coequata anomalia eccentrici partibus 150. perficitur. Ex his exemplis satis iudicari potest, qua ratione verum epicycli diurnum motum venari oportet, vel ad singulos gradus coequatæ anomalie eccentrici, vel quinos vel denos, pro arbitrio vel commoditate cuiusq;.

*Verus planeta
cursus.*

1.

*In apogeo
epicycli.*

Apogeon eccentrici.

Alia loca eccentrici.

Nunc etiam planetæ verum cursum similiter exemplis ostendo, quibus omnis ferè comprehensa est varietas. Est autem æqualis motus diurnus commutationis scr. 27 1^a, 41 2^a, & dimidium eius scrupulorum 13 1^a, 51 2^a. Videndum est primum, quantus sit verus motus planetæ transeuntis per apogeon epicycli, in quacunq; etiam parte eccentrici orbis centrum epicycli versetur. Quando ergo coequata anomalia epicycli vel commutationis est par. 0. scr. 13 1^a, 51 2^a. Prosthaph. orbis est scrupulorum 5 1^a, 12 2^a, & excessus scr. 0 1^a, 38 2^a. Duplum igitur æquationis orbis, videlicet, scrupula 10 1^a, 24 2^a, est verus diarius planetæ transeuntis per apogeon sui epicycli, dum huius centrum versatur in apogeo eccentrici. Ferrur autem planeta per superius epicycli segmentum in consequentia, & plurimum quidem in ipso apogeo. Ideo si hunc diurnum motum adiunxeris scrupulis 25 1^a, 50 2^a, habebis verum diarium integrum seu adparentem ☿ transeuntis per vtriusq; circuli apogeon scr. 36 1^a, 24 2^a. Duplum verò excessus scrupulorum 1 1^a, 16 2^a, quæ addita scr. 10 1^a, 24 2^a, conficiunt verum diarium planetæ transeuntis per apogeon quidem epicycli, at per eccentrici perigeon, qui similiter additus ad congruentem verum diarium epicycli, vt transeuntis per eccentrici perigeon, constituit verum diarium adparentem planetæ. Sed si ad alia eccentrici loca hæc accommodare libet vsui erunt rursum scrupula proportionalia perinde vt supra in præcepto

cepto 34, ut coequata anomalia eccentrici 50. graduum præbet scrupula ferè 7 1^a , quibus de excessu scrupulorum 1 1^a , 16 2^a , competunt scrupula 0 1^a , 9 2^a ferè, quæ addita scr. 10 1^a , 24 2^a , dant emendatum verum motum planetæ congruentem huic loco eccentrici scr. 10 1^a , 33 2^a . At in eodem loco verus epicycli inuentus est scr. 27 1^a , 30 2^a . Verus igitur diarius planetæ adparens est scr. 38 1^a , 42, quando videlicet planeta transit per apogeon epicycli anomalia eccentrici coequata existente partium 50. Similis omnino calculi ratio est, planeta eunte per epicycli sui perigeon, nisi quod cursus epicycli verus conueniens aufferendus est vero planetæ, quia reliquum ostendit regressum planetæ in præcedentia. Addo igitur aliud exemplum, dum anomalia coequata epicycli est parium 120. Ac primum coequatæ anomalix epicycli partium 119. scr. 46 1^a , 9 2^a respondet equatio orbis par. 36. scr. 35 1^a , 57 2^a , excessus autem partium 8. scr. 2 1^a , 25 2^a , sed coequatæ anomalix par. 120. scr. 13 1^a , 51 2^a , æquatio par. 36. scr. 38 1^a , 8 2^a , excels. par. 8. 5 1^a , 54 2^a , ita ut posteriora ambo sint maiora prioribus, cum quidem additio utrobique exigatur. Itaque differentia æquationum scr. 2 1^a , 11 2^a , est diarius verus planetæ adhuc in consequentia, dum centrum quidem epicycli versatur in apogeo eccentrici, planeta aut distat à vero apogeo sui epicycli partib. 120. Sed diff. utriusque, excels. scr. 3 1^a , 29 2^a , addita scr. 2 1^a , 11 2^a , constituit verum diarium, dum centrum epicycli versatur in perigeo eccentrici. Quod si utrobique adiunxeris verum diarium epicycli, coaceruabis verum adparentem planetæ ad talem positum planetæ simul & epicycli. Verum si ad alia loca eccentrici verum planetæ motum velis adaptare, adhibendus erit rursus vsus scrupulorum proportionalium, quibus pars de excessuum differentia cōgruens adijcienda semper est differentix æquationum orbis. Id quia antea declarati exemplo, ociosum esset denuo repetere. Sed hoc meminerit logista, quem hæ rationes omnino sagacem, nec ignauum esse volunt, quod quando posterior æquatio orbis minor est priori, motus planetæ per se fiat in præcedentia. Ideo planeta paulatim tardius procedit, donec æquatis motibus in contrarias partes videtur aliquandiu consistere. Hinc verò etiam retrò legit priora vestigia, nempe quando planetæ motus in præcedentia superat iam motum epicycli in consequentia. Verum hæc vberius alibi traduntur.

Initium igitur huius regressus in epicyclo, norandum quoque, erit

Canone, in quo è regione graduum sub dodecatemorijs, vel sexa. *Initium regressus.* genis partium aptè collocabis veros motus diarios tum epicycli cum scrupulis proportionalibus, tum planetæ in apogeo eccentrici, cum excessu, ac quæ de semicirculis supra dicta sunt, similiter hic tum de eccentro, tum de epicyclo accipi debent. Postremo quoties ex Cano-

ne sic comparato depromendus erit diarius Planetæ adparens, per co-
æquatam quidem eccentri anomaliam accipiat verus epicycli. vnâ
cum scrupulis proportionalibus, verus autem Planetæ cum excessu
per coæquatam epicycli anomaliam: & de excessu primùm sumatur
pars congruens semper addenda motui vero Planetæ, qui similiter,
dum fertur in consequentia, addendus est vero epicycli, alioqui mi-
nor eorum auferendus est à maiori. Reliquum enim erit motus Pla-
netæ in præcedentia vel consequentia iuxta proprietatem eius motus,
qui superabit.

Poterant hoc loco subijci mox præcepta de stationibus & regressi-
bus harum s. stellarum, de latitudinibus, item de exortibus, & occul-
tationibus earundem. Verùm quia aliquid etiam dicendum erit de
mutuis earum inter se coniunctionibus & quando cum stellis inerran-
tibus potissimum ijs, quæ per Zodiacum circulum sparsæ sunt, con-
grediantur: quia hi congressus stellarum maximas cient tempestates,
& varias effectiones consideratione dignas. prius absoluiamus ea, quæ
ad integram doctrinam duorum luminum pertinent, videlicet συζυ-
γίασ, id est, συνόδου καὶ πανσελήνης, tum alias in vniuersum, tum ve-
rò Eclipticas. Inde reuertemur ad 5. planetas, & finem huic labori no-
stro imponemus.

XXXVII. PRAECEPTVM. QVOMODO INQVI-

ratur tempus periodicæ Syzygiæ binorum planetarum.

περὶ συζυ-
γίας.

DE SYZY-
GIIS.

Initiò rursum de eruditis adpellationibus, quæ apud Ptolomæum
extant, breuiter admonere volo studiosum. Adpellatione Syzygiæ
velut generis intelligit Ptolemæus & Synodos, & diametros, id est,
tùm coniunctiones, tum oppositiones, vt vulgò vocant, vel συνόδου,
καὶ πανσελήνης, quoties de duobus luminibus, Sole & Luna propriè
loquitur. Interpretes Arabicorum scriptorum ad eundem modum ge-
neraliter vsurparunt nomen adplicationis. Est autem Syzygiarum alia
rursum periodica alia vera, seu ἀκρίβεια quarum hæc circa veros, alte-
ra circa æquales motus versatur. Accidit vero in ☉ ac ☽, vt ἀκρίβεια
συζυγίας interdum sit ecliptica, ita vt in Synodo vel nouilunio ☉ ob-
scuretur, in πανσελήνῃ autem vel plenilunio deficiat ipsa ☽. Quæ qui-
dem singillatim deinceps erunt explicanda.

Nunc reuertor ad institutum præceptum, quod initium ac velut fun-
damentum est totius sequentis doctrinæ seu πραγματείας. Præcepti
autem ratio hæc est. Diurnum motum æqualem tardioris Planetæ
aufer à diurno æquali velocioris. In hanc vt vocant, superationem di-
urnam partire integram circulum, vel partium sexagenas sex iuxta do-
ctrinam

Strinam Diuisionis supra in logistice traditam. Quotus enim numerus ostendet tempus, quod inter duas proximas $\sigma\upsilon\zeta\upsilon\gamma\iota\alpha\sigma$ intercedit, distributum in dies & dierum tum scrupula, tum fortè etiam sexagenas, ut motus longitudinis Δ à \odot , vel superatio diurna est part. 12. scr. 11 1^a, 26 2^a. 4 1^a, 3 0 4^a, in quem distributus integer circulus vel graduum sexagenæ 6. ostendunt tempus periodicæ Syzygiæ \odot & Δ , quod mensē vocant Synodicum, dierum 29. scr. 3 1 1^a, 50 2^a, 8 3^a, vel dierum totidem horarum autem 12. scr. 44 1^a, 3 2^a, 12 3^a, ferè. Tantum enim temporis inter duos proximos luminum, vel coitus vel diametros positus medios interiectum est.

Aliud exemplum. Differentia diurnorum motuum longitudinis æqualium h & Δ est, scr. 2 1^a, 58 2^a, 40 3^a, 16 4^a, 51 5^a, 25 6^a, in quam distributus totus circulus ostendit dierum sexagenas secundas 2. primam 0. dies 53. scrupulāq; 3 2 1^a, 28 2^a, 28 3^a, ferè, id est, dies 72 53. vel annos Aegyptios 19, diesq; 3 18. ac scrupula vnus diei reliqua Hoc nimirum tempus intercedit inter duos proximos h & Δ coitus, vel diametros positus medios siue æquales.

Iam hoc nemo ignorare potest, cuius totum datur, eius semissem. & quadrantem etiam dari: ut totum tempus periodicæ syzygiæ \odot & Δ dierum est 29 horarum 12. scr. 44 1^a, 3 2^a, 12 3^a. Semissis verò eiusdem temporis dierum 14 horarum 18. scr. 22 1^a, 1 2^a, 36 3^a. Quadrans autem dierum 7 horarum 9. scr. 11 1^a, 0 2^a, 48 3^a, quod quò proficit scire, sequentia præcepta docebunt.

XXXVIII. PRAECEPTVM. DATVM TEMPVS

quantum antecedit vel sequatur proxima $\sigma\upsilon\zeta\upsilon\gamma\iota\alpha$ periodica binorum planetarum.

Ad datum tempus per 8. propositionem inuenias æqualem longitudinis motum vtriusq; Planetæ, & tardioris motum aufer motui velocioris, assumpto integro circulo, si vsus postulat. Hoc reliquum vbi diuideris in diurnam superationem, ut in præcedenti præcepto, emerget illud tempus, cuius interuallo proxima Synodos eorundem planetarum datum tempus antecedit. Vel si idem reliquum toti porro circulo demiseris, & huius reliquias similiter rursus distribueris, exibit tempus, cuius interuallo proxima Synodos datum tempus consequitur. Subijcio nunc huius partis exemplum vnum atq; alterum. Estq; propositum inuenire initium anni 1555. quot diebus antecedit. vel sequatur proxima Syzygia $\sigma\upsilon\zeta\upsilon\gamma\iota\alpha$ \odot & Δ . Distantia igitur vel superatio æqualis Δ à \odot ad initium eius anni id est, ad mediam noctem, quæ calendas Ianuarij antecedit (ut supra docuit 4. præceptum)

M 3

est

I. est sexagenæ 1. part. 33. scr. 58 1^a, 33 2^a, 32 3^a. Hanc superationem partitus per diurnam superationem par. 12. scr. 1 1^a, 26 2^a, 41 3^a, venaberis iuxta diuisionis doctrinam dies 7. scr. 42 1^a, 31 2^a, 40 3^a, id est, præter 7. dies integros, horas 17. scr. 0 1^a, 40 2^a, quæ à proxima συζυγία σινωδῶν duorum luminum antecedente præterierunt vsq; ad initium dati anni. Vel si reliquum arcum de toto circulo sexagenarum 4. part. 26. scr. 1 1^a, 26 2^a, 28 3^a, similiter distribuas in diurnum. Dà recessum æqualem, inuenies dies 21. horas 19. scr. 43 1^a, 23 2^a, 11 3^a, quo nimirum spacio temporis proxima syzygia synodica consequitur illud ipsum initium dati anni.

*Altera pars
præcepti.*

Et si non necesse est, utraq; harum syzygiarum diuisionis opera explorare, sed alteram earum subsidio præcedentis præcepti inuestigaueris multò compendiosius in hunc modum. Quia iam constat ab antecedenti synodo media, quæ incidit in Decembrem anni 1554. expleri dies 7. horasq; 17. cum scrupulis 0 1^a, 40 2^a, vsq; ad initium dati anni, ad tempus periodicæ syzygiæ inuentum est dierum 29. horarum 17. scr. 44 1^a, 3 2^a, 11 3^a. ab eo tempore ablatis dies illi 7. horæq; reliquæ cum scrupulis ostendunt syzygiam proximam & primam anni. dati 55. fieri plenis iam ab ipsius initio diebus 21. horisq; 19. ac scrupulis 43 1^a, 23 2^a, 11 3^a.

*De temporibus
ante di
lunium.*

Ad hunc igitur modum, si memoria tenes ea quæ supra in præceptis subtractionis logistiques dicta sunt de Epochis retrò constituendis, inuenies tempora mediarum syzygiarum ad datum mensem, cuiuscunq; dati vel assumpti anni, qui retrò etiam vel diluuium antecessit.

*Media 6 B
& 4 me
Xg'sop.*

Alterum exemplum. Scire libet media 6 B & 4 nouissima quantum antecesserit initium annorum Domini. Aequalis longitudinis 6, ut à prima stella Asterismi V. est sexagenæ 1. part. 6. scrup. 41 1^a, 51 2^a, 26 3^a, qui ablati ab æquali longitudinis 4 motu sex. 2. partium 54 scrup. 41 1^a, 3 2^a, 25 3^a, relinquit superationem 4 sexagenæ vnius partium 47. scrup. 32 1^a, 11 2^a, 59 3^a. quæ diuisa in superationem eorundem diurnam, quæ est scrupulorum 21 1^a, 58 2^a, 40 3^a, 16 4^a, 51 5^a, 25 6^a, ostendunt dierum sexagenas primas 36. ac dies 6. scrupulaq; 43 1^a, 36 2^a, 8 3^a. diei vnius fere. id est, dies 2166. vel annos Aegyptios 5. diesq; 335. & reliqua scrupula. Tanto tempore vltima σινωδῶν 6 B & 4 antecessit initium annorum Christi, quod tempus ablatum à tempore periodicæ syzygiæ eorundem patefacit similiter primam Synodon ab eodem initio factam esse plenis iam annis Aegyptijs 13. ac diebus præterea 342. scrupulisq; 48 1^a, 52 2^a, 20 3^a, vnius diei, id est, anno decimo quarto, die quinto Nouembris, cum à media nocte antecedenti præterissent horæ 19. scr. 32 1^a, 55 2^a.

Hoc

Hoc constituto principio, cum & datum sit tempus Periodicæ syzygiæ condiderit Mathematicus studiosus sine magno labore canonem mediarum \odot H & 24. ac similiter mediarum \odot tum H & 3, tum 24 & 3. Quod cuiusq; arbitrio ac diligentia interea relinquo.

De canonibus condendis mediis syzygiarum.

XXXIX. PRAECEPTVM. DATO ANNO QVO-

modo tempus medij vel nouilunij, vel plenilunij
dati mensis inuestigetur.

Duplex est via huius inuestigationis, prior ex ipsis petita fontibus, **DVPLEX**
quam haecenus tradidi, altera verò vulgaris, deinceps explicanda, cui **VIA.**
deserviunt canones \odot & \odot mediarum in annis Iulianis. Ac prior **PRIOR.**
quidem etsi non desiderat longiorem explicationem, tamen hoc etiam
addam, quomodo, si ad mensem Ianuarij dati anni inuentum fuerit
tempus medij nouilunij, reliquorum inde mensium eiusdem anni me-
dia tum nouilunia, tum plenilunia deprehendantur. Vt autem ex-
emplis potius, quam longis verborum ambagibus, Vt ad initium an-
ni 1555. inuentum est medium nouilunium Ianuarij accidere exple-
tis diebus 21. horis 19. scr. 43 1^a, 23 2^a. Si iam voles scire medium ple-
nilunium Ianuarij, vt antecedens, aufer semissem Periodicæ syzygiæ,
de quo in fine 37. præcepti dictum est, dierum scilicet 14. horarum 18.
scr. 22 1^a, 22 2^a, ferè. Sic enim adparet medium Ianuarij plenilunium
accidere exactis ab initio anni diebus, 7. hora 1. scr. 21 1^a, 21 2^a. Sed
eodem semisse addito dieb. 21. horis 19. ac reliquis scrupulis, erit sum-
ma dierum 36. horarum 14. scr. 5 1^a, 24 2^a, vnde abiectis 31. diebus
Ianuarij pleni, patet plenilunium Februarij euenire expletis ab initio
ipsius diebus 5. horis 14. ac scrupulis cæteris. Eodem modo continu-
ata serie disces ordinè tempora singulorum mediorum nouiluniorum
& pleniluniorum totius anni.

Quod si voles extra ordinem cognoscere medium nouilunium
aut plenilunium certi mensis dati anni, in quo Ianuarij nouilunium sic
datum est, exemplo monstrabimus rationem similiter adhibendam
cæteris. Seruit autem huic negotio canon generalis \odot & \odot media-
rum \odot & \odot in mensibus. Sit datus mensis Iunius eiusdem anni 1555.
cuius medium plenilunium scire velim. Quintus igitur mensis Maius
absolutus est. Itaq; in Canone illo generali è regione 5. mensis Lu-
naris excerpe dies 147. horas 15. scrup. 40 1^a, 16 2^a, quæ adde die-
bus 21. horis 19. scrup. 43 1^a, 23 2^a, erit summa dierum 169. hora-
rum 11. scrup. 23 1^a, 39 2^a. Ac ex canonio anni Iuliani vsq; ad fi-
nem Maij, vel initium Iunij à Calendis Ianuarij sunt in anno commu-
ni dies 151, qui abiecti ex ea summa ostendunt medium nouilunium
mensis

mensis Iunij fieri absolutis diebus 18. horis 11. scr. 23 1^a, 39 2^a, & ab-
iectus rutilum semilunij periodicæ Syzygiæ relinquit dies 3. horas 17.
scr. 1 1^a, 37 2^a Iunij, quod est tempus medij plenilunij in Iunio. Nec
addam plura exempla. Sed si quis forte ob ingenij tarditatem hæc non
satis adsequitur huic consultam erit, vt sequentem rationem reddat sibi
familiarem.

Preceptum eius ita se habet: primum ingredi canonem Epocharum
σ & σ mediarum vel à diluuiio, vel à Christo iuxta dati ratio-
nem cum numero hecatontaeteridum, qui proximè minor est nu-
mero datorum annorum plenorum, excerpens sub titulo temporis dies
& horas cum scr. inde similiter cum reliquis annis, ac tandem cum ple-
nis mensibus. Omnibus his ordinè coniectis in vnam summam confer
dies ad numerum dierum in canonio reuolutionum, qui proximè
maior adscriptus est è regione notæ σ. si tempus σ. vel notæ σ. si
tempus σ. querendum est. Ab eo enim numero ablata hæc summa
relinquit dies & horas cum scrupulis elapsa ab initio mensis dati ad
tempus medij vel nouilunij, vel plenilunij. Exemplo fit res illustrior.
Sit querendum medij plenilunij tempus incidens in mensem Iunium
anni 1555. à Christo. Primum cum annis 1500 à Christo excerpe dies
11 horas 3. scr. 28 1^a, 2 2^a, & cum annis 54. dies 26. horas 2. scr. 16 1^a,
41 2^a deniq; cum Maio anni communis dies 3. horas 8. scr. 19 1^a, 44
2^a. Nam bisexti rationem memento ubiq; habendam esse in omnibus
huius generis Canonibus. Iam hæc tribus ingressibus excerpta gignunt
summam dierum 40 hor. 14. scr. 4 1^a, 27 2^a. At in Canonio reuolutio-
num è regione notæ σ numerus proximè maior est dierum 44. hora-
rum 7. scr. 6 1^a, 5 2^a, è quibus summa illa detracta relinquit dies 3.
horas 17. scr. 1 1^a, 38 2^a. Medium igitur plenilunium mensis Iunij pa-
tet fieri elapsis iam ab initio eius diebus tribus horis 17. sc. 1 1^a, 38 2^a,
planè sicut in priori ratione.

Aliud exemplum. Cupio scire tempus medij nouilunij, quod futu-
rum est mense Aprili anni Christi 1567. Annis ergo 1500. ex Canone
epocharum à Christo respondent, vt prius, dies, 11. horæ 3. scr. 28 1^a,
2 2^a, & annis 66. dies 9 hora 0. scr. 5 2 1^a, 47 2^a, & tribus plenis men-
sibus anni communis dies 1. horæ 9 scr. 47 1^a, 50 2^a. Quæ omnia col-
lecta, sunt in summa dies 21. horæ 14. scr. 8 1^a, 39 2^a. At in Canonio
numerus proximè maior è regione notæ σ est dierum 29. hor. 12. scr.
44 1^a, 3 2^a. Vnde prior abiecta summa dierum & horarum relinquit
dies 7. horas 22. scr. 35 1^a, 24 2^a. Erit igitur tempus medij nouilunij
Aprilis anni 1567. cum iam ab initio eius mensis fuerint elapsi, dies
nimirum 7. horæ 22. ac scrupula reliqua, vt modò inuenimus.

Cæterum

fol. 87.

+ fol. 91.

Cæterum visitatum est, nouilunijs adpellationem tribuere non ab illis mensibus, in quos incidunt, sed potius à sequentibus, in quibus vnusquisq; terminatur. Vnde notus est versiculus. In quo completur, mensi lunatio detur. Quod etiam obiter monendum erat.

XL. PRAECEPTVM. QVA RATIONE EXPLORE tur tempus mediæ Syzygiæ duorum luminum

☉ & ☽ ritè constitutum esse.

Tempus autem modò inuentum vtrum medio nouilunio vel plenilunio ritè congruat, sic examinabis. Ad ipsum tempus iuxta doctrinam 8. præcepti subducito rationem æqualis motus longitudinis ☽ à ☉. qui in medio quidem plenilunio semicirculum, at in nouilunio integrum absoluisse peritus circulum debet restitutus suo principio, quia hic æqualia loca ☉ & ☽ incidunt in idem signiferi punctum, illic verò in eandem rectam lineam ex diametro terræ secundum longitudinem. Exemplo nihil opus esse arbitror.

Quòd si Syzygiæ tempus aliorum quorumcunq; binorum planetarum calculo voles etiam examinare. exquisiti hoc modo æquales eorum motus longitudinis à prima stella ♀ debent penitus inter se congruere in sexagenis partibus ac scrupulis deniq;. Vt si explorabis tempus primæ Syzygiæ synodicae ♄ & ♀. post initium annorum Christi, videbis vtrinq; stellam à prima ♀ abesse ad illud tempus sexagenis 3. partibus 56. scrupulisq; 54 1^a, 3 2^a, 3 2^a.

XLI. PRAECEPTVM. DE MOTIBVS AEQUALIBUS ☉ & ☽ congruentibus dato tempori mediæ syzygiæ eorundem.

Vt rectè venari possis tempus veræ Syzygiæ ☉ & ☽. opus est cognitione verorum, aut saltem mediorum locorum congruentium tempori medij nouilunij aut plenilunij. Medios igitur motus colliges iuxta 8. præceptum. siquidem priorem rationem exquirendi tempus mediæ Syzygiæ secutus es. Sed iuxta posteriorem rationem & tempus mediæ Syzygiæ, & æquales motus vna eademq; opera comparabis, nisi quòd æquales motus, quos Canonion reuolutionum suppeditat, iam addere oportet prioribus, cum in temporis constitutione antè facienda esset subtractio. Sed ne quis exemplum fortè desideret, esto vnà cum tempore medij plenilunij eius, quod incidit in mensem Iuniū anni 1555. inueniendus medius motus ☉ simplex. Cum annis igitur 1500. ingredienti canonem hecatontaeteridum ☉ & ☽. offeruntur dodecatemoria 8. part. 11. scr. 36 1^a, 22 2^a. Similiter cum annis 54. plen. dodecatemoria 11. partes 3. scr. 25 1^a, 5 2^a, & cum plen. mensibus 5. dodecatemoria 4. part. 25. scr. 3 1^a, 41 2^a, deniq; in Canonio reuolutionum dodecatemorium 1. part. 13. scrup. 39 1^a, 30 2^a. Quæ omnia

nia iuxta singulas species coaceruata dant dodecatemorion. 1. par. 24. scr. 13 1^a, 25 2^a. Similiter & reliquos æquales motus tum ☉. tum ☿. itemq; æqualis præcessionis, & anomalie æquinoctiorum colligendos esse scias. Mutabis autem hæc dodecatemoria, quando vsus aliquis poscit vel in sexagenas, vel in partes circuli.

XLII. PRÆCEPTVM. IN DATA MEDIA SIVE

æquali luminum syzygia, quantus existat verus cursus ☿ à medio loco ☉, vel ab eius diametro sub dato horarum numero, ante vel post mediam syzygiam.

Duplex ratio.

Datam nunc mediam syzygiam vocamus, cuius non solum tempus datum est ex præcedentibus, sed & anomalia ☿. Duplicem igitur rationem aperiemus. Alteram egregij artificis Nicolai Copernici, cui deferuit Canonion generale ☉ & ☿. verarum ☉ & ☿. alteri verò deferuit duplex Canon prior & posterior, distantie veræ ☉ vel ☿ à media ☉ & ☿.

A. Copernici.

Copernici ratio sic tractatur. Primum cum data anomalia ☿. æquali (quia in medijs syzygijs duorum luminum æqualis anomalia habetur & coequata) ingressus Canonem Prosthaphærescon ☿ excerpe Prosthaphæresin primi epicycli auferendam ante semicirculum, addendam verò post, vt supra dictum est. Hanc interea adferuabis: postea cum dato numero horarum intra Canonion, quod dixi generale excerpens tot horis respondentes motus, æqualem quidem longitudinis, verum autem anomalie ☿ cum scrupulis proportionalibus. Hanc anomaliam veram inuenta anomalia ad mediam syzygiam addes, si horæ numeratæ fuerint post mediam syzygiam, auferas autem si ante eandem retrò fuerint numeratæ. Ita comparabis coæquatam ☿, anomaliam congruentem tempori, quod mediam syzygiam totidem horis vel antecedit vel sequitur. Per hanc anomaliam & scrupula proportionalia modò excerpta venare Prosthaphæresin primi epicycli, prorsus vt docuit 24. præceptum. Iam si hæc Prosthaphæresis posterior æqualis est priori. ipse æqualis motus longitudinis existit vera quoq; euectio ☿ à ☉ sub dato horarum numero, sed si fuerint inuicem inæquales, differentia earum æquali motui longitudinis vel addenda

Tres regulae est, vel demenda iuxta has regulas.

de Additione

et Subtractione

one.

PRIMA. Quando vtraq; æquatio auferenda est, siquidem posterioris temporis æquatio maior extiterit, differentia earum æquali motui longitudinis auferatur. Sed si minor adijcitur.

SECUNDA Quando verò vtraq; Prosthaphæresis primi epicycli addenda est, & posterioris temporis minor fuerit, differentia earum auferenda

aufferenda est, sed si maior, additur æquali motui longitudinis.

TERTIA. Quando æquationes ambæ primi epicycli fuerint diuersæ adfectionis seu speciei iunctæ eadem æquali motui longitudinis Δ adduntur quidem, si posterioris temporis æquatio fuerit addenda, sed aufferuntur, si fuerit aufferenda. Iuxta has tres regulas indagabis veram Δ euectionem à medio quidem loco \odot in synodo, vel nouilunio medio, sed ab eius opposito in medio $\pi\alpha\nu\sigma\epsilon\lambda\eta\nu\omega$, id est, plenilunio.

Subjicio nunc exempla, quæ lucem regulis nostris adferent. *Ad sy- Exempla*
zygiam mediam plenilunij mensis Iunij anni 1555. inuenta est æqualis anomalia Δ partium 86. scr. 54 1^a , 34 2^a , cui Prosthaphæresis primi epicycli respondet ex Canone par. 4. scr. 53 1^a , 27 2^a , Libet iam scire, quanta sit à loco, qui medio \odot opponitur vera euectio Δ spacio decem horarum, qui mediam hanc syzygiam proximè comitantur. Ex Canonio igitur generali 10. horis conuenit equalis motus longitudinis par. 5. scr. 4 1^a , 46 2^a ferè. Sed verus anomalie par. 8. scr. 12 1^a , 24 2^a ferè, cum scrupulis proportionalibus 0 1^a , 36 2^a . Partes igitur 8 scr. 12 1^a , 24 2^a adiectæ anomalie partium 86. scrup. 54 1^a , 34 2^a , constituunt coæquatam anomaliam congruentem ei tempori, quod 10 horis posterius est media syzygia, partium videlicet 95. scrup. 6 1^a , 58 2^a . Per hanc Prosthaphæresis primi epicycli colligitur par. 4. scrup. 57 1^a , 57 2^a , subtrahenda itidem ut prioris temporis æquatio part. 4. scr. 53 1^a , 27 2^a . Cum igitur posterioris temporis æquatio sit maior quàm prioris, differentia vtriusq; scr. 4 1^a , 30 2^a , ablata æquali motui longitudinis part. 5. scr. 4 1^a , 46 2^a , relinquit veram Δ euectionem à medio \odot part. 5. scr. 0 1^a , 16 2^a , congruentem 10. horis proximis post mediam syzygiam.

Similiter si velim scire in eodem exemplo euectionem veram 11. horarum post mediam syzygiam, præbet rursum Canonion è regione 11. horarum motum æqualem longitudinis part. 5. scrup. 35 1^a , 15 2^a , & motum verum anomalie part. 9. scr. 1 1^a , 16 2^a , quæ anomalie æquali ad mediam syzygiam congruenti addenda sunt ideo, quia horæ hæc 11. posteriores sumuntur, sicut prius, ut sit iam coæquata anomalia part. 95. scr. 55 1^a , 50 2^a , & scr. proportionalia 0 1^a , 43 2^a . Huic coæquate anomalie congruit $\pi\sigma\omicron\delta\alpha\phi\alpha\iota\sigma\epsilon\iota\varsigma$ primi epicycli part. 4. scr. 58 1^a , 14 2^a , subtrahenda differens ab ea, quæ competit mediæ syzygiæ scr. 4 1^a , 47 2^a . Cum autem utraq; earum sit aufferenda, & posterioris quidem temporis æquatio maior, ideo differentia earum ablata medio motui longitudinis 11. horarum relinquit veram Δ euectionem ab eo loco qui medio \odot oppositus est, partium scilicet 5. scrup. 30 1^a , 28 2^a .

Vitandæ prolixitatis causa non addo hic plura exempla, præsertim cum posteriori ratione uti liceat, si quis scrupulus in hoc priori occurrat.

2.
Vulgaris &
expedita
ratio.

Altera ratio minus est operosa. Nam cum anomalia Δ , quæ congruit tempori mediæ syzygiæ ingressus canonem vel priorem vel posteriorem sub dato horarum numero mox accipies veram Δ à medio loco \odot euectionem seu digressionem, siquidem extremus limes omnino habuerit numerum tuæ anomaliæ. Sed si fortè eundem non simpliciter habuerit, cum numero qui proximè minor est, ingressus excerpere partes scrupulæq; è regione vnâ cum differentia, descendente quidem, si anomaliæ partes fuerint pauciores semicirculo, ascendente verò, si plures, è qua differentia iuxta denarij analogiam (quia Canon ipse per decades proficiscitur) inuentam partem congruentem priori numero graduum & scrupulorum adiunges semper ante completum semicirculum anomaliæ, sed post semicirculum auferes. Sic enim conflabis veram Lunę euectionem à medio loco Solis, vel eius diametro sub dato horarum numero. Adde exempla, ac primò repetatur proximum, in quo erat sub mediam syzygiam æqualis anomalia Lunæ partium 86. scr. 55. ferè. Velim rursus scire, quantum Luna à loco, qui medio Solis aduersus est, vehatur spacio decem horarum, quæ proximè syzygiam illam sequuntur. Ingressus ergo Canonem cum 80. gradibus tanquam numero proximè minori, offendo sub. 0. horis partes 4 scr. 55 1^a. 22 2^a, cum differentia descendente scr. 7 1^a. 2 2^a, è quibus iuxta denarij rationem pars congruens reliquis gradibus 6. scr. 55 1^a, est scrupulorum 4 1^a. 57 2^a, quam subtilissimè inquisita secundum doctrinam $\tau\delta\epsilon\pi\iota\epsilon\alpha\lambda\lambda\omicron\upsilon\tau\omicron\varsigma$ supra traditam in logistica. Hæc itaque congruens pars adiecta gradibus 4. scr. 55 1^a. 22 2^a, exhibet summam partium 5. scr. 0. 1^a. 19 2^a, quod à priori paucillum discrepat. Hæc est vera euectio Δ ab illo loco \odot decem quidem horis post mediam $\sigma\upsilon\zeta\upsilon\gamma\iota\alpha\mu$ dum æqualis anomalia data est partium 86. scr. 55 1^a, sed ante mediam syzygiam totidem horis, si eadem anomalia daretur partium 273. scr. 5 1^a. Quæ vtrobiq; possunt habere vsum, ut patet in sequentibus.

EXEM-
PLA.
1.

2.

Alterum Exemplum. Tempore mediij nouilunij mensis Aprilis anni 1567. æqualis anomalia Δ partium est 89. scr. 3 1^a, ferè. Libet scire ex priori Canone veram Δ motum interuallo 13. horarum post Eum igitur ingressus cum anomalia 80. graduum sub 13. horis, excipio partes 6. scr. 24 1^a. 31 2^a, cum differentia descendente scrupulorum 9 1^a. 20 2^a, è quibus congruunt partibus 9. scr. 3 1^a, iuxta denarij rationem scrupula 8 1^a. 27 2^a, quæ adiecta partibus 6. 24 1^a. 31 2^a, colligunt veram Δ euectionem

Deuectionem ab eo loco \odot congruentem 13. plenis horis post mediam syzygiam videlicet partium 6. scr. 32 1^a, 58 2^a. Quantum etiam Deuehitur ab eodem loco totidem horis ante mediam \odot syzygiam, si anomalia æqualis extiterit part. 270 scr. 57 1^a. Vt enim in vniuersum o-
ciosa quæstio est de horis ante mediam syzygiam, dum anomalia maior est gradibus 32, vel minor 153. aut de horis post mediam syzygiam, quando eadem anomalia maior est partibus 207. minorq; partibus 328. ferè ita etiam Canonem nostrum ad necessarios tantum vsus accommodandum esse consueimus.

Similis etiam vsus est posterioris Canonis. Verum quando conueniat ingredi vel priorem, vel posteriorem Canonem in hac $\pi\alpha\rho\mu\alpha\tau\epsilon\iota\varsigma$ id infra indicabo.

XLIII. PRAECEPTVM. DE MOTV HORARIO

Lunæ vel à Sole. vel à prima stella \vee . ante vel post datas horas à media Syzygia data.

In utroq; Canone distantie σ vel ρ veræ à media adscriptus est motus horarius Δ à medio loco \odot tanquam lateralis differentia. Rursum igitur, vt in præcedenti præcepto. cum anomalia æquali, quæ congruit mediæ syzygiæ ingressus canonem vel priorem vel posteriorem, (id quod postea diserte monebimus) excerpe motum horarium sub dato numero horarum, & venare, si opus est, partem congruentem addendam vel subtrahendam, prout anomalia vel descendit, vel ascendit in extremo limite, prorsus vt in præcedenti præcepto factum est. Verum ne quid ambigui relinquatur, accipe exemplum vnum atq; alterum.

In priori igitur duorum præcedentium exemplorum cum anomalia sit partium 86. scr. 55 1^a ferè, primum 80 gradibus sub horis 10. respondet motus horarius Δ scr. 29 1^a, 41 2^a. sed 90. gradibus scr. 30 1^a, 26 2^a. Differentia igitur congruens 10. gradibus cum sit scrupulorum 45 1^a, erit pars congruens 7. ferè gradibus scrupulorum 31 2^a, quæ adiecta scrupulis 29 1^a, 41 2^a, (quia motus horarius per totum hunc priorem semicirculum anomaliam accrescit) efficiunt verum horarium Δ à medio \odot scr. 20 1^a, 12 2^a. Huic si adiunxeris æqualem horarium \odot scr. 2 1^a, 28 2^a, habebis verum horarium à prima stella \vee ad datum momentum temporis scr. 32 1^a, 40 2^a.

In posteriori autem exemplo anomalia itidem est partium 89. scr. 3. ferè Queratur motus horarius 13. horis post mediam syzygiam elapsis. Ex canone igitur priori sub 13. horis respondet gradibus 80. quidem æqualis anomaliam motus Δ horarius scrupulorum 29 1^a, 46 2^a, sed 90 gradibus scrupulorum 30 1^a, 29 2^a, vt sit differentia congruens 10 anomaliam gradibus scrupulorum 43. vnde congruunt 9. partibus

HORARI.
VS à \odot .

scrupula 39 2^a, ferè, quæ adiecta scrupulis 29 1^a, 46 2^a, constituunt sub hoc momentum temporis & loci Δ verum eius horarium, à medio quidem \odot scrupulorum 30 1^a, 25 2^a, sed additis rursus scrupulis 2 1^a, 28 2^a, à prima stella \vee scrupulorum 32 1^a, 53 2^a.

Hoc præceptum magno nobis vsui erit in sequenti $\pi\alpha\gamma\mu\alpha\tau\epsilon\iota\varsigma$ verorum nouiluniorum & pleniluniorum, præsertim Eclipticorum, quoniam Δ motus non constat sibi, verum in singulas horas mutatur, plurimum quidem circa apogeon primi Epicycli decrescens, & circa perigeon eiusdem accrescens, minimum verò circa medias eiusdem Epicycli longitudes.

XLIIII. PRAECEPTVM. DATVM ZODIACI ARCVM

cum siue ante, siue post mediam syzygiam luminum datam
quanto temporis spacio Luna verè à medio
loco \odot pertranseat.

Datam mediam syzygiam intelligo vt hæcenus, in qua præter tempus anomalie quoq; lunaris motus offertur, vel ex tempore ipso inuenius est iuxta 41. præceptum. Datum verò Zodiaci arcum, cuius longitudo numero partium diserte exprimitur. Cum autem Δ æquali motus diurnus à \odot sit 12. partium patet binis eam horis vnum ferè gradum Zodiaci peruagari, sic vt duplum dati numeri partium Zodiaci vtrunq; hoc ipsum tempus commonstret, quo Luna datas Zodiaci partes cursu suo expediat.

Verum vt quæsitum tempus non obiter tantum, sed subtili ratione definiatur, inuenias. Primum per 42. præceptum, quantus existat verus Δ cursus sub hoc æstimato vel adsumpto horarum numero à medio loco \odot . Quod si hic inuentus arcus cursus Lunæ æquauerit se dato arcui Zodiaci, ipsum adsumptum tempus tenendum erit pro vero. Si autem fuerit inæqualis, datum arcum multiplicatum per numerum horarum adsumpti temporis diuide per partes arcus modo inuenti. Sic enim exhibet verum tempus, quo Luna datum Zodiaci arcum verè percurrit. Verum exempla addi solent rebus obscurioribus.

Esto igitur in media syzygia plenilunij mensis Iunij anni 1555. propositum inuenire, quanto tempore Δ à medio loco \odot verè conficiat partes Zodiaci 5. scrupulq; 23 1^a, 20 2^a, nempe post mediam syzygiam. Ac quia constat id fieri horis 10. ideo iuxta priorem vel posteriorem rationem traditam in 42. præcepto inuenio quod horis 10 post mediam syzygiam Luna verè emetiatur à medio loco \odot partes signiferi 5 scrup. 0 1^a, 16 2^a, anomalia eius existente partium 86. scr. 55 1^a. Nam hoc datum prærequiritur, vt dixi. Reliquum huius calculi expeditur secundum doctrinam partis proportionalis adhibita multiplicatione

plicatione primū. postea diuisione. Itaq; cum Luna partes 5. scrup
 0 1^a, 16 2^a, perambulet vero cursu à medio loco ☉ horis 10. manife-
 stum est ex doctrina proportionum, quod partes 5. scr. 23 1^a, 20 2^a,
 perambulet horis 10. scr. 46 1^a, 20 2^a ferè. Poteris etiam hac forma
 uti, Distributis partibus 5. scr. 0 1^a, 16 2^a, in decem, exit motus ☽ ho-
 rarius scrupulorum 30 1^a, 2 2^a. In hunc si rursus diuidas partes 5. *Alia forma*
 scr. 23 1^a, 20 2^a, dati arcus Zodiaci, inuenies horas 10 scrupula 45 1^a,
 57 2^a ferè, vt prius.

Verum quia ☽ motus horarius non est sui similis, sed mutabilis in
 horas, sequentem rationem magis fortasse probabunt ij, quibus volu-
 pe est, numerorum, vti ita dicam summam veritatem exquirere. Nam
 post adsumptas illas horas vnà inuentus ☽ motus horarius iuxta an-
 tecedens præceptum, paulò propiùs collimabit. Verum hanc quoq;
 formam exemplo penitus addisces. Sit ergo propositum sub mediam
 nouilunij syzygiam, quod in mensem Aprilem incidit anni 1567. in-
 venire, quanto tempore post mediam syzygiam ☽ à medio ☉ verè
 conficiat datum Zodiaci arcum, partium scilicet 6. scr. 39 1^a, 29 2^a. Est
 autem anomalia æqualis ☽ sub ipsam mediam syzygiam part. 89. scr.
 3 1^a ferè. Ideo iuxta doctrinam præcepti 42. vera euectio ☽ à ☉ interval-
 lo horarum 15. post mediam syzygiam est partium 6, scr. 32 1^a, 58 2^a,
 siue priorem rationem sequaris, siue posteriorem. Et similiter 13. horis
 post colligitur iuxta doctrinam præcepti antecedentis motus ☽ ho-
 rarius scrupulorum 30 1^a, 25 2^a, à medio loco ☉. Et quoniam vera
 euectio ☽ à ☉ minor est, quàm datus arcus Zodiaci scrupulis 6 1^a,
 31 2^a, manifestum est, quod ☽ eundem datum arcum tardius emetia-
 tur quàm horis 13. Ideo differentia illa scrupulorum 6 1^a, 31 2^a, di-
 uisa in motum horarium ostendit 13. horis adhuc adjicienda esse ho-
 ræ vnus scrupula 12 1^a, 52 2^a ferè.

Monstravi huius inuestigationis seu calculi præcipuas formas ac re-
 gulares, quibus probè cognitis poterit interdum sagax logista nonnul-
 lis vti compendijs quæ nunc omitto properans ad sequentia, in quibus
 antecedentium præceptorum vtilitas conspicietur.

XLV. PRÆCEPTVM. VTRVM TEMPVS VERAE

luminum syzygiæ posterius sit, vel prius tempore
 datæ syzygiæ mediæ.

Non dubium est, quin quoties verus ☽ locus præcedit verum ☉
 sub mediam syzygiam, veræ syzygiæ tempus posterius sit tempore
 mediæ syzygiæ, e contra verò, quoties sub eandem mediam syzygiam
 verus Lunæ sequitur verum Solis, tempus veræ syzygiæ prius est tem-
 pore syzygiæ mediæ. Præcedere autem stella Astronomica consuetu-
 dine

dine intelligitur ea, quæ vel ab æquinoctio vel à prima stella ∇ . vel ab alio quopiam principio in consequentia minus distat, quàm altera, cui comparatur, ut si Sol versetur in 8 parte \odot . Luna in prima Parte \odot . dicitur Luna præcedere Solem. & vicissim Sol sequi Lunam.

Iam ut cognoscas, utrum lumen sub ipsam datam mediam syzygi-
am præcedat alterum, per coæquatam anomaliam & simplicem ano-
maliam, æquinoctiorum exquire Prosthaphæresin orbis absolutam simili-
ter per anomaliam ∇ . æqualem exquire $\pi\sigma\delta\alpha\phi\alpha\gamma\epsilon\sigma\iota\upsilon$ primi Epicycli
Lunæ. Dato enim tempore mediæ syzygiæ, simul etiam has quas di-
xi anomalias dari è superioribus præceptis manifestum est. His ergo
equationibus ambabus ritè inuentis, pronuntiabis iuxta sequentes regu-
las utrum lumen præcedat, vel sequatur.

Tres regulae.

PRIMA. Quando utraq; Prosthaphæresis, \odot inquam, & ∇ , fue-
rit adiectiua, præcedit id lumen, cuius est minor adiectiua tantum, quan-
ta est ipsarum Prosthaphæreseon differentia.

SECUNDA. Quando utraq; Prosthaphæresis est ablatiua, præce-
dit lumen cuius est maior ablatiua, tantum, quanta est ambarum dif-
ferentia.

TERTIA. Quando verò Prosthaphæreses non sunt eiusdem spe-
ciei, sed altera earum adiectiua, altera autem ablatiua, præcedit id lu-
men, cuius æquatio est ablatiua, tantum quanta est summa utriusq;
Prosthaphæreseos.

Exempla mox sequentur.

XLVI. PRAECEPTVM. DE INTERVALLO TEM-

poris quod intercedit inter datam mediam syzygiam & veram
eiusdem mediæ. Et de tempore veræ syzygiæ.

*Συζυγία
ἀληθής.*

In hoc præcepto & sequentibus adparet vsus multorum anteceden-
tium, quæ hic summam repetuntur. Regulæ autem traditæ in præ-
cedenti præcepto satis perspicue docent, quanto arcu Zodiaci distent
in vicem duo lumina sub ipsam datam mediam syzygiam, & utrum
lumen præcedat alterum, deniq; quanto tempus veræ syzygiæ prius
sit, vel posterius tempore syzygiæ mediæ. Quanto igitur spacio tem-
poris ∇ datum Zodiaci arcum verè emetiatur à medio loco \odot , siue
antè, siue post hanc mediam datam syzygiam, scies adminiculo 44.
præcepti.

*Quando ven-
dum sit priori
vel posteriori
Canone di-
stan-*

Verum quod hactenus distulimus, nunc dicendum, est de vsu Ca-
nonis utriusq; distantiae veræ σ vel ρ à media, dum sequimur poste-
riorem duarum rationum, quæ supra præcepto 42. traditæ sunt. Ac-
curatè igitur meminerit logista, quod in hac $\pi\sigma\alpha\gamma\mu\alpha\tau\epsilon\lambda\epsilon\alpha$ vtendum sit
priori

priori canone tunc, quando prosthaphæreses \odot & D fuerint diuersæ *tia vera* & speciei, vel ambæ quidem eiusdem speciei, maior autem prosthaphæ-vel P & *me-* restis D . Posteriori autem Canone, quando rursus fuerint eiusdem *dia*, speciei, maior autem prosthaphæresis \odot . Voco autem eiusdem speciei, cum utraq; est vel adiectiua, vel ablatiua: diuersæ verò cum altera earum adiectiua, altera verò ablatiua. Ad hunc igitur modum habebis interuallum temporis, quod inter datam mediam syzygiam & veram eiusdem mediæ intercedit. Quæ ut dextrè intelligantur, accomodemus ad utrunq; eorum exemplorum quibus hætenus vsi sumus.

Primum exemplum, Data mediæ syzygiæ plenilunij mensis Iunij anni 1555. tempus supra inuentum est 3. dies, horæ 17. scr. 1 1^a, 38 2^a, sub Meridiano Regijmontis Borussiae. Itaq; anomalia simplex est sex, 2. part. 49. scr. 44 1^a, 32 2^a, ac propterea prosthaphæresis centri \odot . partium 1. scr. 30 1^a, 10 2^a, addenda, & inde coæquata \odot anomalia sex. 5. part. 43. scr. 50 1^a, 7 2^a, cum scrupulis proportionalibus 0 1^a, 33 2^a, Vnde existit prosthaphæresis orbis absoluta partis 0. scr. 29 1^a, 53 2^a, adiectiua. Similiter per anomalam D æqualem sex. 1. part. 26. scr. 53 1^a, 34 2^a, colligitur $\pi\sigma\theta\delta\alpha\phi\alpha\lambda\epsilon\sigma\iota\varsigma$ primi epicycli partium 4. scr. 33 1^a, 30 2^a, ablatiua. Et quoniam prosthaphæreses non sunt eiusdem speciei, & ablatiua quidem D ideo sub ipsam mediam syzygiam per 3. regulam præcepti antecedentis D præcedit vel anterior est \odot . & distantiam ipsorum mutuam ostendunt iunctæ prosthaphæreses \odot & D , quæ simul sunt partes 5. scr. 23 1^a, 28 2^a. Et quoniam tempus veri congressus horum luminum posterius est tempore mediæ syzygiæ, colligo per 44. præceptum, quod D hunc arcum partium 5. scr. 23 1^a, 28 2^a, perambulet a medio loco \odot hori. 10. scrupulisq; 45 1^a, 40 2^a ferè. Tantum igitur est temporis interuallum inter datam hanc mediam & veram eiusdem syzygiam, quod adiectum tempori mediæ syzygiæ dierum 3. horarum 17. scr. 1 1^a, 38 2^a, ostendit verum illud plenilunium mensis Iunij fieri plenis dieb. 4. horisq; 5. scr. 47 1^a, 18 2^a, ferè, ut à media nocte, quæ diem Iunij quintum antecedit.

Alterum exemplum. Similiter medij nouilunij mensis Aprilis anni 1567. tempus est dierum 7. horarum 22. scr. 35 1^a, 24 2^a & anomalia simplex sex. 2. part. 50. scr. 59 1^a, 6 2^a, & inde tum coæquata anomalia \odot sex. 1. part. 47. scr. 32 1^a, 40 2^a, tum scrupula proportionalia 0 1^a, 25 2^a, per quæ tandem habetur absoluta prosthaphæresis orbis \odot partium 1. scr. 44 1^a, 42 2^a, adiectiua. Similiter per anomalam D æqualem sexa. 1. part. 29. scr. 3 1^a, 19 2^a, excerptitur æquatio primi epicycli D part. 4. scr. 54 1^a, 46 2^a, 37 3^a, ablatiua cumq; Solis sit diuersæ speciei, nempe adiectiua, manifestum est veri nouilunij tempus

O

posterius

posterius esse tempore mediæ syzygiæ Iunctæ igitur prosthaphæreses
 ☉ & ☽ ostendunt distantiam, qua Luna est anterior Sole, partium vi-
 delicet 6. scr. 59 1^a, 29 2^a. Has partes & scr. ☽. peragrat post mediam
 syzygiam horis 13, scr. 12 1^a, 48 2^a fere, iuxta doctrinam præcepti
 44. Tantum scilicet intervallum temporis inter mediam & veram sy-
 zygiam novilunij mensis huius interiectum est: cumq; verus congressus
 luminum sit posterior medio addito hoc intervallo ad tempus mediæ
 syzygiæ, existit tempus veræ synodi plenæ diebus Aprilis 8. horis 11,
 scr. 48 1^a, 12 2^a, quod est circa meridiem diei 9. Aprilis. Hæc omnia
 sub Meridiano Regij montis Borussia.

*Maximum
 intervallum
 mediæ & ve-
 ræ syzygiæ.
 ☉ & ☽.*

Cæterum quia maximum intervallum inter mediam & veram sy-
 zygiam, nunquam implet horas 15. ideo Canon distantia veræ ☉ vel
 ☽ à media terminantur in 15. horas, nec ultra progreditur.

XLVII PRÆCEPTVM. QVOMODO EXPLORE-

tur, vtrum tempus veræ syzygiæ recte constitutum sit nec ne, &
 de calculo verorum motuum & ☽ & latitudinis ☽.

*πρὸ τῆς δο-
 κίμασις
 τῶν χρόνων.*

Suprà in præcepto 41 ostendimus, quomodo cum tempore mediæ
 syzygiæ investigandæ simul colligendi sint sine magno labore hi æqua-
 les motus, videlicet, præcessionis æquinoctiorum, anomaliam simpli-
 cis, simplicis ☉, annuæ anomaliam ☉, anomaliam ☽, deniq; latitudinis
 ☽. Iam ut iidem recte accommodentur ad tempus veræ syzygiæ, ex-
 cerpe ex æqualium motuum Canonibus eorundem generum, quæ re-
 citavi, motus, ac præterea etiam æqualis longitudinis ☽ à ☉ particu-
 las congruentes intervallo temporis, quo differunt veræ & mediæ sy-
 zygiæ, & ubi singulorum generum particulas coaceruaveris in vnam
 summam, servato discrimine specierum has summas adde vnamquaq;
 sui generis motui, siquidem veræ syzygiæ tempus fuerit posterius,
 quam mediæ alioqui aufer inuicem. Ita enim vel coaceruabis vel re-
 linques æquales motus horum generum ad veræ syzygiæ tempus. Ve-
 rum æqualis præcessionis & anomaliam simplicis, quemadmodum &
 prosthaphæresis centri ☉ cum scrupulis proportionalibus in tantillo
 spacio temporis non desiderant hanc correctionem.

Per coæquatam igitur anomaliam ☉ & scrupula proportionum
 comparabis prosthaphæresin orbis ☉ absolutam. Similiter per coæ-
 quatam : anomaliam æquationem primi epicycli venaberis. Quibus
 additis inuicem si diuersæ, vel ablatis, si fuerint eiusdem speciei, sum-
 ma vel differentia debet esse æqualis medio motui longitudinis, si ius-
 tam in toto hoc cursu calculi diligentiam adhibuisti. Sed si fuerit inæ-
 qualis & quidem differentia maior vno atq; altero scrupulo primo,
 vitiosus est calculus, & propterea iterandus. Quod ne opus esse ali-
 quando

quando accidat, in tua diligentia situm est, quam ut præstare queas, vsum horum præceptorum mediocriter tibi familiarem esse oportet.

Verum prius exemplum propono, postea additurus reliqua. *Plenilunium mensis Iunij anni 1555.*
 dium igitur plenilunium mensis Iunij 1555. prius est vero plenilunio horis 10. scrup. 45. 1^a. 40. 2^a ferè, quibus de æquali motu simplici ☉ comperunt ex canone scrup. 26. 1^a. 30. 2^a, adiijciendi æquali motui, qui congruit mediæ huic syzygiæ sex. 0. partium 54. scrup. 13. 1^a. 25. 2^a, ut sit æqualis ☉ simplex sex. 0. part. 54. scr. 37. 1^a. 55. 2^a, congruens veræ syzygiæ, ad quam congruunt etiam anomalia æqualis ☉ sex. 5. part. 42. scr. 46. 1^a. 38. 2^a. & longitudinis ☽ à loco diametro ☉ partium 5. scr. 27. 1^a. 57. 2^a, & anomaliæ æqualis ☽ sex. 1. partium 32. scr. 46. 1^a. 32. 2^a, deniq; latitudinis ☽ sex. 1. partium 34. scrup. 42. 1^a. 25. 2^a. Per coæquatam igitur ☉ anomaliæ sex. 5. partium 44. scr. 16. 1^a. 47. 2^a, excerpitur prostaphæresis orbis ☉ absoluta scr. 29. 1^a. 9. 2^a, adiectiua. Similiter per coæquatam ☽ anomaliæ sex. 1. part. 35. scrup. 44. 1^a. 11. 2^a, & scrupula proportionalia 0. 1^a. 42. 2^a, excerpitur prostaphæresis primi Epicycli absoluta part. 4. scr. 58. 1^a. 11. 2^a ablatiua, quæ addita prostaphæresi ☉ conflat partes 5. scr. 27. 1^a. 20. 2^a, quæ paucis secundis abluunt à medio motu longitudinis Lunæ. Hac igitur doctrina constat iam tempus veræ syzygiæ satis emendatè ac scrupulosè à nobis inuentum esse.

Porrò iam absolutum vera loca vtriusq; luminis ab adparenti æquinoctio, & verum latitudinis ☽ motum, à Boreo scilicet limite. Ut verus ☉ à prima stella ♀ est sex. 0. part. 55. scr. 9. 1^a. 4. 2^a. & quia præcessio vera æquinoctij est partium 27. scr. 38. 1^a. 51. 2^a, ideo verus ☉ ab adparenti æquinoctio est sex. 1. part. 22. scr. 47. 1^a. 55. 2^a, similiter verus ☽ est partium 0. scr. 29. 1^a. 46. 2^a, ut à loco, qui medio ☉ adversus est, distans iam ab adparenti æquinoctio sexagenis 4. part. 22. scr. 8. 1^a. 46. 2^a. Vnde verus ☽ abest ab eodem æquinoctio sex. 4. partibus 22. scr. 48. 1^a. 32. 2^a.

Præterijt igitur verus ☽ oppositum verum ☉ scrupulis 37. 2^a, quæ duplicata & ablata ex tempore veræ syzygiæ prius inuento relinquunt eiusdem tempus quàm correctis. Tenenda est enim regula quando ☽ motus superat locum ☽ vel eius diametrum, quia præterijt vera syzygia, excessus duplicatus auferendus est prius inuento tempori, alioqui addendus, si excessus fuerit ☉.

Postremò verus latitud. motus est sex. 1. partium 29. scr. 44. 1^a. 14. 2^a. *Novilunium mensis Aprilis anni 1567.*
 Similiter in altero exemplo novilunij Aprilis anni 1567. erat intervallum temporis veræ & mediæ syzygiæ interiectum, horarum 13. scr. 12. 1^a. 50. 2^a ferè, quibus congruit æqualis motus longitudinis ☽ à ☉

partium 6. scr. 42 1^a, 43 2^a. Per coæquatam verò ☉ anomaliam sex. 4. partium 48. scr. 5 1^a, 14 2^a, colligitur prosthaphæresis orbis absoluta part. scr. 44 1^a, 21 2^a, adiectiua, similiter per coæquatam ☽ anomaliam sex. 1. part. 39. scr. 42 1^a, 31 2^a, prosthaphæresis primi Epicycli partium 4. scr. 58 1^a, 2 2^a, iunctæ igitur prosthaphæreses faciunt partes 6 scr. 42 1^a, 23 2^a, videlicet totidem fere, quot habet æqualis motus longitudinis ☽ à ☉. Verus item motus ☉ ab apparenti æquinoctio est partium 28. scr. 14 1^a, 22 2^a. Verus autem ☽ ab eodem æquinoctio part. 28. scr. 14 1^a, 41 2^a. Transgressa igitur est Luna verum locum ☉ scrupulis 19 2^a, quæ duplicata auferenda sunt ex tempore veræ syzygiæ prius inuento. Postremo verus motus latitudinis ☽ est sex. 1. part. 24. scr. 19 1^a, 28 2^a.

XLVIII. PRAECEPTVM. DE TEMPORE CALCVL

li veræ syzygiæ commutando in tempus adparens.

πρὸ πρῶτα
φαιζέσθω
τῶν ὡραίων
χρόνων.

Quemadmodum Canones Astronomici vtuntur tum æquali tempore, tum motibus æqualibus, vt inde exhibeant consentanea obseruationibus, & apparentijs motuum inæqualium, ita etiam hæc tempora syzygiarum à canonibus suppeditata æqualia sunt, ac per se non congruunt adparentiæ, quam constat sui esse dissimilem. Etsi autem supra de æquatione τῶν ὡραίων satis prolixè disputatum est in primo præcepto summam tamen primæ illius eruditæ rationis breuiter nunc denuò repetere, atq; exemplis harum duarum syzygiarum illustrare non incommodum est.

Collatis igitur inuicem ambabus differentiis, reclarum inquam ascensionum, ac æqualium motuum compositorum, si excessus fuerit æqualium motuum, ipse dato tempori veræ syzygiæ adponatur: sed si fuerit reclarum ascensionum, auferatur. Hoc nimirum artificio tempus calculi æquale exæquabitur adparentiæ inæquali. Est autem æqualis motus ☉ compositus ad initium annorum CHRISTI part. 278. scr. 2 1^a, 16 2^a, & veri loci ☉ ascensio recta temporum 279. scr. 55 1^a, 33 2^a, vt supra inter Epochas æqualium motuum annotauimus. Porro calculum duarum syzygiarum, quas hactenus singulis præceptis adhibuimus, ab Epocha æqualium motuum Christi deduximus.

De priori exemplo plenilunij mensis Iunij anni 1555.

Sub huius veram syzygiam æqualis motus ☉ compositus est partium 81. scr. 53 1^a, 46 2^a. Veri autem loci ☉ vt ab adparenti æquinoctio recta ascensio est temporum 82. scr. 9 1^a, 25 2^a. Ablatis ergo ijs, quæ sunt prioris temporis χροῖ, ab ijs, quæ sunt posteriori, vt syzygiæ, erit differentia æqualium quidem motuum compositorum part. 163. scr.

51^a, 502^a. Partium verò temporalium 162, scr. 131^a, 522^a. Differentia ergo æqualium motuum excedit differentiam ascensionum tempore vno, ac scr. 371^a 382^a, quibus ex canone conuersionis temporum Aequinoctialis respondent scrupula 61^a, 312^a, horæ vnus. Hæc est dierum æquatio temporis veræ syzygiæ prius inuento adiungenda, eò quod excessus est æqualium motuum. Erit igitur huius veri plenilunii tempus adparens diebus iam plenis quatuor, horis 3, scr. 531^a, 492^a, ab initio mensis Iunij sub Meridiano Regij montis Borussiae. Vnde hoc tempus transferetur ad alia loca adminiculo Canonis Regionum.

Subijcio & alterum exemplum nouilunii mensis Aprilis anni 1567, ac ne pluribus verbis opus sit, calculum ipsum pono ob oculos.

	Compositorum æqualium			Ascens. Rect.		
	partes	/	//	tempora	/	//

Σύγκρισις seu collatio Differentiarum.

	par.	/	//
Æqualium mot.	103	5	39
Asc. Rect.	106	18	7

Excessus , // 1 47 32 æqualium

Id est. scrupula 7. 10. vnus horæ addenda temporis prius inuento.

Ideo tempus nouilunii adparens sub Meridiano Regij montis est expletis diebus 8 horis 11, scr. 551^a, 422^a, mensis Aprilis.

XLIX. PRAECEPTVM. DE ADPARENTIBVS SEMIDIAMETRIS duorum luminum ☉ & ☽, & de semidiametro vmbrae.

Vt primum dicatur de adparente ☉ Semidiametro, habeas in promptu ad datum quodcunq; tempus anomaliam ☉ coæquatam. Deinde ex præcepti 17. doctrina habeas exploratum, quanta sit ☉ eccentricus, minima dico, an media, vel maxima, vel cui harum propior. Postea intra Canonem semidiametrorum cum anomalia ☉ coæquata, & excerpe adscriptam sub conuenienti titulo semidiametrum ☉ adparentem adhibita correctione, si opus fuerit. Vt in vera synodo mensis Aprilis anni Christi 1567, coæquata anomalia ☉ est partium 288. ferè. Huic sub minima Eccentricitate huius seculi respondet semidiameter ☉ adparens scr. 161^a, 92^a.

Ad eundem modum, cum coæquata anomalia ☽ nouæ & plenæ excerptes & semidiametrum ☽ adparentem, & semidiametrum vmbrae in

loco transitus D , ubi rursus canonis quoque indicio observanda est \odot Eccentrotetes. ut in plenilunio mensis Iunij anni 1555. coequata anomalia D partium est $95^{\circ} 1^{\circ} 44^{\circ}$ ferè. cum qua ingredienti eundem offertur D semidiameter scr. $6^{\circ} 1^{\circ} 23^{\circ} 2^{\circ}$. Similiter in altera parte Canonis semidiameter umbræ scrupulorum $44^{\circ} 1^{\circ} 38^{\circ} 2^{\circ}$, ut in minima \odot eccentrotete.

*Variatio
umbræ.*

Verum quia motus \odot in eccentrico orbe subinde variet terrenæ umbræ tum longitudinem tum profunditatem, cui D in deliquijs suis immergitur, Canon autem suppeditet tantum semidiametros eius umbræ quam iactat terra Soli apogeo opposita, ideo per eandem \odot coequatam anomalam simul ex Canone excerpitur variatio umbræ semper auferenda. siquidem Sole apogeo terra umbram projicit omnium maximam. Ut in dicto plenilunio existit anomalia \odot coequata partium 344° . ferè, cum qua ingredienti offertur variatio umbræ scrupuli tantum $1^{\circ} 2^{\circ}$ subtrahenda. Aequata igitur semidiameter umbræ congruens proximè inuentæ semidiametro Lunari valet scrupulis $44^{\circ} 1^{\circ} 37^{\circ} 2^{\circ}$ vnius videlicet partis trecentesimæ ac sexagesimæ totius circuli.

L. PRAECEPTVM. QVAE PLENILVNIA

sint Ecliptica.

*πρότις ἐκ-
λειψῶσ σὲ-
λιωτικῆς.*

Haecenus communia diximus defectuum tam \odot . quam Lunæ. Deinceps persequemur primum ea. quæ ad Lunæ deliquia propriè pertinent, quibus absolutis redibimus ad ea. quæ propriè sunt eclipsium solarium, & tandem rationem describendi typos earum aperiemus. Inde reuertendum nobis erit ad quinq; errantes.

*Ptolemæi.
κεττιςίου.*

Tradit autem Ptolemeus hoc argumentum ecliptici plenilunij, si sub ipsam mediam syzygiam inter æqualem \odot locum & alterutrum nodorum obliqui circuli lunaris interiectum fuerit spaciū minus gradibus $1^{\circ} 5'$, cum quinta parte vnius, siue in priora numeres, siue in posteriora. Ut quia sub mediam syzygiam plenilunij mensis Iunij anni 1555. medius motus latitudinis D est part. 88. scr. $46^{\circ} 1^{\circ} 31^{\circ} 2^{\circ}$, manifestum Lunam admodum vicinam esse nodo deuehenti, ac præcedere tantum parte 1. & scr. $13^{\circ} 1^{\circ} 29^{\circ} 2^{\circ}$. Pronunciab'is ergo ex Ptolemæi sententia illud plenilunium fore Eclipticum.

*Aliud.
κεττιςίου.*

Verum licet & hoc propriè argumento uti. Quando sub ipsam veram plenilunij syzygiam latitudo vera Lunæ minor fuerit summa semidiametrorum ipsius. & umbræ, subibit Eclipsin: alioqui expers erit huius iacturæ. Ut in eodem vero plenilunio deprehendimus per motum verum latitudinis part. 82. scr. $44^{\circ} 1^{\circ} 14^{\circ} 2^{\circ}$, veram Lunæ latitudinem boream partis 9. scr. $11^{\circ} 2^{\circ} 22^{\circ}$, tantum iuxta doctrinam præce-

pit

pit 29. At per præcedens præceptum semidiameter \mathcal{D} , adparens inuenta est scr. 16 1^a , 23 2^a , Vmbra verò scr. 44 1^a , 37 2^a vt faciat summa vtriusq; scrupula 61 1^a , 0 2^a , non dubium igitur est, quin hoc plenilunium futurum sit Eclipticum, ita vt luminis sui, quod haurit ex Sole, iacturam in diametro ipsius posita factura sit Luna.

L I. P R A E C E P T V M. Q V A N T V S S I T F V T V R V S

defectus \mathcal{D} vel de digitis Eclipticis.

Magnitudo defectus Solaris & Lunar is dupliciter considerari solet, nempe vel secundum superficiem corporis sphaerici, vel ipsius diametrum. Quomodo autem deprehendatur pars superficiei vel recta, vel obscurata, consulatur Ptolemæi *μεγάλῃ συντάξει*, aut commentarij nostri seu aliorum. Facilius est ratio atq; expeditio, quæ defectus magnitudinem iudicat ex diametri partibus, quas & digitos vocant artifices, & 12. ei tribuunt, propterea quod adparens tùm Solis tùm Lunæ diameter tres circiter palmas æquare videatur.

Habeas igitur ex præcedentibus, & scrupula veræ latitudinis Lunæ & semidiametros vmbrae ac Lunæ adparentes. Erit igitur & summa vtriusq; semidiametri nota, & ablati inde scrupulis latitudinis \mathcal{D} nota similiter erunt scrupula reliqua de summa vtriusq; semidiametri. Cum his igitur reliquis scrupulis & tota \mathcal{D} . diametro adparente ingrediẽ canonem digitorum eclipticorũ vltimo more, sic vt accipias diametrum adparentem in limite sinistro, reliqua verò scrupula summæ semidiametrorum in capite canonis siue linea transuersa ac si res ita postulat, his ingreditur, & excerpta aggregato inuicem. Sic enim venaberis digitos eclipticos quos vulgus adpellat puncta satis improprie.

Repero exemplum dicti plenilunij, in quo Lunæ vera latitudo inuenta est scr. 1 1^a , 23 2^a & semidiameter \mathcal{C} adparens scr. 16 1^a , 23 2^a , vmbra verò scr. 44 1^a , 27 2^a , vt sit summa vtriusq; semidiametri scr. 61 1^a , 0 2^a . Reliquum igitur de hac summa est scr. 59 1^a , 38 2^a , & tota diameter \mathcal{C} adparens scrupulorum 32 1^a , 46 2^a . Ingressus ergo primò canonem sub scrupulis 50. video scrupulis 32 1^a , 46 2^a , sinistri marginis conuenire digitos 18. scr. 17. facta nimirum emendatione. Inde similiter ingressus cum reliquis scr. 9 1^a , 38 2^a , excerpto conuenienter digitos 3. scr. 20 1^a ferè. Quæ inuicem coagmentata efficiunt digitos 21. scr. 49 1^a ferè, qualium videlicet digitorum tota \mathcal{C} . diameter adsumitur duodecim. Vnde manifestum est, Lunam in hoc plenilunio penitus immergi in vmbra, nec subito rursus eluctari, sed aliquantisper imorari, ac satis tardè recuperare lumen, vt mox patebit, quia cum exigua sit eius latitudo, transit ferè per ipsam diametrum vmbrae, perinde vt planum orbis solaris.

LII. PRAECEPTVM, QVANTVM SIT TEMPVS

incidentiae vel morae dimidia:

πρὶ χροῦ
ἐξήκοντα ἔμ-
πλώσεως.

Scrupula incidentiae seu, vt Graeci vocant, ἐμπλώσεως, sunt, quae a ☉ peragrat ab initio defectus ad medium quidem eius in partiali, vel totali sine mora, sed ad initium totalis obscuracionis in totali defectu, cui mora accidit. Scrupula repletionis, ἀναπληρώσεως similiter numerantur vel a medio totius deliquij, vel ab initio emerfionis ad finem eclipsidis.

ἐξήκοντα ἡμί-
σους τῆς
μηνῆς.

Scrupula morae dimidia ἡμίσεις τῆς μηνῆς, sunt ea, quae a Sole percurrit Luna ab initio totius immerfionis ad medium tempus eclipsidis, quod quidem a vero plenilunio seu diametro ☉ non differt ad sensum, perinde vt & repletionis ac incidentiae scrupula propemodum sunt inuicem aequalia, sicut haec a Ptolemæo & in aliorum Astronomicis commentarijs explicantur vberius.

Diuisio ecli-
psium Luna-
rium.

Pars tantum Lunaris corporis ingruens in vmbra terrae obscuratur, cum digiti Ecliptici fuerint pauciores 12. Tota deficit Luna sed sine mora, cum digiti omnino fuerint 12. Sed si plures, quam 12 tota deficit cum mora, quae eo producitur longius, quo plures fuerint digiti supra duodecim.

PRAECE-
PTVM.

In Eclipsi igitur Lunae partiali, vel totali sine mora sola incidentiae scrupula exquiruntur, sed in totali Eclipsi, cui mora accedit, primum scrupula incidentiae & morae simul ac summam ex posteriori Canone excerpuntur cui titulum fecimus: Canon scrupulorum incidentiae & morae dimidia simul in defectu ☾. Deinde sola scrupula morae dimidia ex priori Canone similiter. Haec scrupula morae deducta ex priori summa scrupulorum incidentiae & morae dimidia, relinquunt sola scrupula incidentiae.

DATA Hu-
ius praecepti.

Ad harum igitur rerum inuestigationem data haec tria esse oportet, scrupula verae latitudinis, summam semidiametrorum vmbrae & ☾, deniq; differentiam earundem semidiametrorum.

Vsus postero-
ris canonis
scrupulorum
incidentiae.

Ex posteriori igitur Canone, vt dixi, excerpes scrupula incidentiae & morae dimidia in vnam summam interea coagmentata, ingressus vel semel vel iterum cum scrupulis verae latitudinis ☾ & summa semidiametrorum. Ac in emendandis numeris ijs, qui excerpuntur, obseruabit logista, quomodo Canon adsurgat, per singula ne scrupula, an vero per bina ternae, vt partem congruentem rite accipiat. Vt in eodem exemplo, quia latitudo ☾ est scr. 1^a, 22 2^a, & summa semidiametrorum 61 1^a, 0 2^a, colliguntur scrupula incidentiae & morae dimidia summam 60 1^a, 57 2^a, acceptis nimirum scrupulis latitudinis in sinistro limite, & scrupulis summae in linea superiori transversa.

Ex priori

Ex priori autem Canone per eadem latitudinis D scrupula & dif- *Usus prioris*
ferentiam vtriusq; semidiametrorum similiter prorsus excerpe sola *Canonis.*
scrupula moræ dimidiæ, vt in eodem plenilunio cum differentia vtri-
usq; semidiametri vmbre & D sit scr. 28 1^a , 14 2^a , deprehendo scru-
pula moræ dimidiæ 27 1^a , 57 2^a . Hæc ablata ex scrupulis 60 1^a , 57 2^a ,
relinquunt sola scr incidentiæ 33 1^a , 0 2^a .

Iam vt ex his scrup. incidentiæ & moræ dimidiæ tempus vtrumq; *Tempus inci-*
ratiocineris, diuide ea per motum D horarium à \odot supra inuentum, *dentia & mo-*
vt scrupulorum 30 1^a , 12 2^a ferè in hoc ipso plenilunio vero. Itaq; mo- *ra dimidiæ.*
ræ dimidiæ tempus colliges horæ 0. scr. 56 1^a ferè, tempus casus
horæ 1. scr. 5 1^a ferè, vt sit totum tempus ab initio eclipsis ad medium,
vel rursum à medio ad finem horarum 2. scr. 1 ferè, quæ est dimidia
duratio defectus Lunæ. Non ignoro autem hæc posse, vel ex nostris
tabulis aliquanto scrupulosius exquiri. Sed modus etiam sit harum
subtilitatum: nec leue artis beneficium putandum est, calculum vel me-
diocriter cum adparentia consentire, etsi fortè in vno atq; altero scru-
pulo horæ hallucinemur. Grauius enim in hac ipsa πραγµατεία in-
quit Ptolomæus, πρὸς δὲ τὸ τοσούτου ἀκρίβειαν οὐ κενοδοξία μᾶλλον, ἢ
φωλαλίσθη αὐτῇ.

LIII. PRÆCEPTVM. QVOMODO INVENIEN-

da sit vera D latitudo ad initium & finem Eclipsis.

Dato vero motu latitudinis D ad initium & finem Eclipsis, recur-
rendum est ad præceptum 29. Ideo hoc loco tantum compendiosa ra-
tio traditur inueniendi verum latitudinis motum ad extrema tempo-
ra eclipsis, quæ ita se habet. Motum \odot congruentem dimidiæ durati-
oni adde summæ scrupulorum incidentiæ & moræ dimidiæ. Sic enim
conflabis verum D motum simpliciter, vel à prima stellâ V . quem si
vero motui latitudinis inuento ad tempus veri plenilunii abstuleris
quidem, habebis eundem verum ad initium eclipsi, ad finem verò, si
adiunxeris. Porro eitra vllum periculum erroris perpetuo sumpseris
pro motu horario \odot scrupula 2 1^a , 28 2^a .

Exemplum nostri plenilunii. Tempus dimidiæ durationis eclipsis
inuentum est horarum 2. scr. 1 1^a . Huic respondet motus \odot scr. 4 1^a ,
58 2^a ferè, qui additus summæ scrupulorum incidentiæ & moræ dimi-
diæ 60 1^a , 57 2^a , colligit verum D motum scr. 65 1^a , 55 2^a , à prima
 V congruentem tempori dimidiæ durationis. Iam hic verus D abla-
tus quidem vero motui latitudinis, qui congruit ad medium eclipsis
sex. 1. par. 29. scr. 44 1^a , 14 2^a , relinquit verum motum latitudinis ad
initium eclipsis sex. 1. part. 28. scr. 38 1^a , 19 2^a . Sed additus colligit
eundem latitudinis ad finem eclipsis sex. 1. part. 0. scr. 50 1^a , 9 2^a . In-

de per præceptum 29. habetur vera latitudo ☽ ad initium quidem Eclipsis sc. 7 1^a, 7 2^a Borea, ad finem verò eiusdem sc. 4. 1^a, 22 2^a Austri.

Ac de Lunari quidem Eclipsi aliud iam nihil restat, nisi vt ratio proponatur typum Eclipsis describendi in plano. Verùm hoc differemus tantisper, donec parallaxin duorum luminum, ceteraq; ad calculum Solaris defectionis pertinentia absoluta nobis fuerint.

LIIII. PRAECEPTVM, DATO LOCO LVMINIS,

& distantia eius à Meridiano versus ortum & occasum, quomodo parallaxes eius discernendæ sint in data regionis latitudine.

πρὸς ἐκλει-
τικῶν ἡλίου
κῶν.

Datum locum ☉ vocamus, cum dodecatemorion, & pars eius in qua versatur, diserte exprimitur, sed in Luna præterea requiritur distantia eius à verò Epicycli primi apogeo quæ coæquata anomalia appellatur. Datam luminis distantiam à Meridiano intelligimus horas, earumq; scrupula, quibus secundum adparentiam distat ☉ vel ☽ à circulo Meridiano. Condidimus autem Canones trianguli orthogonij parallaxeon, ad has 14. Poli exaltationes, videlicet partium 16. 24. 31, 36. 41 45. 49. 52. 54. 57. 60. 63. 66. 70. quarum priores 7. fere respondent vltatis 7. climatis, ad quæ Ptolemæus suos quoq; Canones in hoc genere accommodauit. Quare cum hæc discretio parallaxium longitudinis & latitudinis potissimum referatur ad Eclipticas synodos, manifestum est, quod hoc præceptum & sequentia desiderent quatuor data. vt tractari queat, quorum primum est, tempus adparens, in quo diserte exprimitur, quæ sit hora ante vel post meridiem, alterum locus ☉, tertium anomalia ☽ coæquata, vltimum latitudo regionis.

Διάκρισις
τῶν πρὸς ἡλίου
κῶν.

Est & hoc firmiter tenendum memoria, quod vera sinodus existens in quadrante signiferi orientali posterior sit adparenti synodo, contrà verò prior in quadrante eiusdem occidentali. Ideo quadrantes hos signiferi magna diligentia ubiq; in illis nostris Canonibus distinximus syllaba. NO. designante nonagesimum gradum Eclipticæ ab vtraq; parte Horizontis. Hæc in genere primum scire oportebat logistam. Nunc præceptum subiicio.

PRAECEPTVM.

Si Sol tenet principium alicuius dodecatemorij, vel parum ab eo abest, ingredi Canonem destinatum dato climati vel altitudini poli, & sub illo signo ad datam horam, vel ante, vel post meridiem excerpere hæc tria, distantiam à vertice, & vtrunq; trianguli latus, longitudinis scilicet, & latitudinis in partibus iisdem, quibus 60. adsumitur Hypothenusa vel latus recto angulo subtensum, quod πρὸς ἀλλὰ ἑκατομῶν in circulo altitudinis accommodatur. Aequabis autem hæc singula adhibita parte proportionali, si qua scrupula horis fuerint annexa,

annexa. Inde cum distantia à vertice ingressus canonem parallaxeon ☉ & ☽ in circulo altitudinis, excerpere parallaxin, quam artifices composito nomine vocant μικροπλατυ, vt iam dixi. Solis quidem simpliciter. Lunæ aut sub congruenti numero anomalie. Quod si de vtraque harum parallaxeon iuxta vsitatam doctrinam ex canone εἰρηκοντάδωρ sumpseris partes congruentes lateribus longitudinis & latitudinis proximè excerptis, habebis vtriusque luminis vtraque parallaxin longitudinis & latitudinis. Sed si parallaxin ☉ dempseris ex parallaxi ☽ & reliquum tractaueris ad hunc modum, venaberis parallaxin latitudinis ☽ ad ☉, quæ quia in hac eclipsium solarium doctrina maximè vsus habet exempla eius subiungam, etsi similis ratio est omnium.

Distantigitur ☉ & ☽ ante meridiem hora 0 scr. 4 1^a, 38 2^a in regione, cuius sit latitudo 54. gra. & teneant interea sanè initium primi dodecatemorii ♀, sitq; Lunæ anomalia cœquata dodecatemiorum 3. part. 10. fere. Ingressienti ergo canonem, qui altitudini poli 54. gra. destinatus est, sub dodecatemorio ♀ cum hora meridiei, vt cui Sol proximus est, initio patet eum locum ☉ vel horam diei comprehendi in quadrante signiferi occidentali, ac propterea veram synodon esse priorem adparenti. Deinde occurrit distantia à vertice graduum 54. scr. 0 1^a, quæ ab hora vndecima vsq; ad 12. qua Sol Meridianum tranfit, id est, spacio 60. scrupulorum vnus horæ decrescit gradu vno, scr. 24 1^a, de quibus debentur 4 1^a, scr. 38 2^a, horæ vnus scrupula 6 1^a, vnus gradus, quæ addita 54. partib. exhibent iam æquatam distantiam duorum luminum à vertice par. 54. scr. 6 1^a. Sicut enim stella nobis conspicua maximo intervallo recedit à nostro vertice oriens & occidens, tunc enim ea distantia quadrantem circuli absoluit: ita ab eodem vertice minimè omnium abest transiens per Meridianum. Similiter excerpere latus longitudinis in triangulo parallaxeos part. 23. scr. 18 1^a, ablata nimirum parte congruente, & contra addita parte sua proportionali, excerpere latus latitudinis partium 55. scr. 15 1^a. Tribuantur autem vtrique lateri tùm longitudinis tùm latitudinis partes eiusmodi, quarum parallaxis μικροπλατυς, numerata videlicet in circulo altitudinis, partium adsumitur 60 vt dixi. Hinc cum distantia à vertice modò inuenta ingressus canonem parallaxeon ☉ & ☽ in circulo altitudinis, excerpere parallaxin μικροπλατυ, ☉ quidem scrupulorum 2 1^a, 24 2^a, Lunæ autem conuenienter sub 3. dodecatemorijs, & 10. grad. anomalie cœquata partium 47 1^a, 15 2^a. Quod si de his parallaxibus sumeres partes congruentes lateribus longitudinis & latitudinis, haberes vtraque parallaxin κατὰ πλατυ (καὶ) μικρος vtriusque luminis

Exempla.

1.

Sol teneat initium alicuius dodecatemorio.

minis secundum se. Deducta autem parallaxi \odot e parall. \mathcal{D} relinquitur excessus \mathcal{D} ad \odot scr. $44\ 1^a$, $51\ 2^a$, de quibus si partes congruentes sumantur lateribus longitudinis & latitudinis paulo ante inuentis, exhibit parallaxis longitudinis quidem \mathcal{D} ad \odot scr. $17\ 1^a$, $25\ 2^a$, latitudinis verò \mathcal{D} ad \odot scr. $41\ 1^a$, $18\ 2^a$.

2.
Non teneat
initium ali-
cuius dodeca-
temorij.

Quod si \odot non teneat initium alicuius dodecatemorij, quemadmodum singuli hi canones ad initia eorum conditi sunt, geminus instat labor. Primum enim ad initium eius dodecatemorij, in cuius aliqua parte \odot versatur, exquires parallaxin vtrinq; ad eum modum, quem hactenus accepisti. Deinde prorsus similiter ad finem eiusdem dodecatemorij, vel, quod idem est ad initium sequentis. Deinde sumes partem congruentem numero graduum \odot in eo dodecatemorio, quem vel addes, vel auferres priori parallaxi, prout posterior vel crescit, vel decrescit. Verum exemplo res melius intelligitur. Transeat igitur \odot per $15\ 1^a$, scrupulum vicesimanonæ partis \mathcal{V} , cæteris datis manentibus, sicut prius. Primum ergo ad initium \mathcal{V} exquiro parallaxin vtrinq; sicut iam factum est. Deinde rursus eodem modo ad initium \mathcal{X} , ubi similis parallaxis \mathcal{D} ad \odot deprehenditur, longitudinis quidem scr. $12\ 1^a$, $56\ 2^a$, at latitudinis scrupulorum $35\ 1^a$, $6\ 2^a$, sicut differentia longitudinis fit scr. $4\ 1^a$, $39\ 2^a$, latitudinis autem scr. $6\ 1^a$, $12\ 2^a$, vtrq; decrescens. Iam part. 28. scr. $15\ 1^a$, quæ numerantur ab initio \mathcal{V} ad locum \odot , congruunt de differentia longitudinis scr. $4\ 1^a$, $22\ 2^a$, subtrahenda de parallaxi longitudinis priori, ut sit vera parallaxis sc. $13\ 1^a$, $3\ 2^a$, similiter de differentia latitudinis congruunt iisdem partibus 28. sc. $15\ 1^a$, scrupula $5\ 1^a$, $50\ 2^a$, auferenda itidem, ut sit æquata parallaxis in latitudinem scrupulorum $35\ 1^a$, $28\ 2^a$.

Aliud exem-
plum.

Aliud exemplum. Cæteris dati, ut prius, quarantur parallaxis \mathcal{D} ad \odot sub initium horæ primæ post meridiem. Ad initium ergo \mathcal{V} primum inuenies parallaxin longitudinis \mathcal{D} ad \odot scrupulorum $26\ 1^a$, $3\ 2^a$, latitudinis autem scrupulorum $38\ 1^a$, $9\ 2^a$, & ad initium \mathcal{X} , longitudinis scrupulorum $21\ 1^a$, $42\ 2^a$, latitudinis scr. $32\ 1^a$, $54\ 2^a$, ita ut differentia parallaxeon longitudinis fit scrupulorum $4\ 1^a$, $21\ 2^a$, latitudinis verò scrupulorum $5\ 1^a$, $15\ 2^a$, vtrq; rursus decrescens. Iam partibus Arietis 28. sc. $15\ 1^a$, congruunt de longitudinis quidem differentia scr. $4\ 1^a$, $6\ 2^a$, at de latitudinis differentia scr. $4\ 1^a$, $57\ 2^a$, itidem subtrahenda à parallaxibus respondentibus initio \mathcal{V} . Aequata igitur parallaxis in longitudinem est scrupulorum $21\ 1^a$, $57\ 2^a$, latitudinis verò scr. $33\ 1^a$, $12\ 2^a$, aptè conueniens locis \odot & \mathcal{D} , atq; reliquis datis.

De parallaxi
in latitudi-
nem.

Ad eundem modum cætera exempla omnia tractanda erunt, etsi hoc quoq; sciat lector ante inuentum tempus adparentis synodi nondum opus

opus esse exquifitione parallaxeos secundum latitudinem, vt in duobus fequentibus præceptis, fatis est exploratam esse longitudinis parallaxin.

Fui in explicatione huius præcepti eò prolixior, quia fequentium nullum fructum percipiet logifta, nifi huius vsum probè prius percalluerit.

LV. PRÆCEPTVM. IN DATO TEMPORE QVANTUS fit Lunæ motus adparens à Sole.

Ad dati temporis interuallum inuenias per 43. præceptum veram D euectionem à ☉. Deinde iuxta præcedens præceptum parallaxim longitudinis D ad ☉ tam ad initium quàm finem dati temporis. Parallaxis enim latitudinis in hoc & fequenti præcepto nondum habet vsum. Postea considera, vtrum datum tempus totum prætereat ☉ hærente in quadrante signiferi orientali, an totum in quadrante occidentali, an verò in vtrunq; distrahatur. Si totum tempus consumitur in quadrante orientali, & parallaxis ad initium quidem temporis maior fuerit, quàm ad finem, differentiam parallaxeon auffer vero motui D à ☉, sed si minor fuerit, adijunge eam. Sin autem toto dato tempore Sol versatur in quadrante occidentali, & parallaxis ad initium huius temporis maior fuerit, quàm ad finem, differentiam ipsarum adde veræ euectioni D à ☉. alioqui aufferes, si parallaxis ad temporis initium fuerit minor, quàm ad finem. Si deniq; datum tempus distrahitur in ambos quadrantes vt prior pars consumatur in orientali, posterior in occidentali quadrante post gradum nonagesimum, adiunges vtrunq; parallaxin eidem veræ euectioni. Iuxta has tres regulas scias colligendum esse adparentem D motum à ☉ in dato tempore. Sed exemplum subijcio, quod lucem adferet præcepto. Estlo igitur propositum scrutari visum D motum à ☉ in hora vna, scrupulis 4 1^a, 38 2^a, ad regionem, cui Boreus polus exaltatur gradibus 54. Sitq; initium temporis ante meridiem scrupulis 4 1^a, 38 2^a, exitus autem vna hora post meridiem. Sint & reliqua data eadem, vt in præcedenti præcepto. Primum igitur per 43. præceptum in dato hoc tempore Luna verè conficit à ☉ sc. 32 1^a, 46 2^a, quia horarius à ☉ supra inuentus est scr. 30 1^a, 24 2^a. Deinde per antecedens præceptum inuenta est parallaxis D ad ☉ sub initium quidem temporis scrupulorum 13 1^a, 3 2^a, at sub exitum scr. 21 1^a, 57 2^a. Totum autem tempus datum elabitur, ☉ circumuecto in quadrante occidentali, id est, postquàm iam transijt gradum nonagesimum, & prior parallaxis minor est, quàm posterior. Ideo iuxta secundam regulam differentia vtriusq; parallaxeos scrupulorum scilicet 8 1^a, 54 2^a, auferenda est veræ euectioni D à ☉. Erit igitur adparens euectio D à ☉ scrupulorum 23 1^a, 52 2^a, in hora vna scrupulis 4 1^a, 38 2^a.

Tres regulae.

1.

2.

3.

*Adparens
Luna sim-
pliciter.*

*Distantia
visæ copula
ac veræ,*

Quod si loco veri motus Δ à \odot sumseris eiusdem verum à prima stella V , vel ab adparenti æquinoctio, & cætera tractaueris eodem, ut dictum est modo habebis visum Δ motum non à \odot , verum simpliciter.

LVI. PRAECEPTVM. DE INTERVALLO TEM-

poris inter veram Synodum duorum luminum & adparentem.

Ad tempus veræ synodi inuenias parallaxin longitudinis Δ à \odot per 54. præceptum. Similiter per præceptum antecedens inuenias adparentem Δ motum à \odot vel vnus horæ vel duarum, præcedentium quidem veram \odot in orientali, sequentium autem in occidentali signiferi quadrante. Quod si parallaxis longitudinis multiplicata per tempus cõgruens motui Δ apparenti à \odot , diuisa fuerit per ipsum motum Δ apparentem, exibat differentia temporis inter veram synodum & adparentem.

Reperatur idem exemplum nouilunij, quo hæcenus vñ sumus, & deinceps ad finem vsq; huius tractationis adhibebimus. Inuenta est igitur parallaxis longitudinis sub ipsam veram \odot $54^{\circ} 09'$ scrupulorum $13^{\circ} 1^{\circ}$, $3^{\circ} 2^{\circ}$, iper præceptum 54. & adparens Δ motus à \odot scrupulorum $23^{\circ} 1^{\circ}$, $52^{\circ} 2^{\circ}$, spacio nimirum vnus horæ, ac scrupulorum $4^{\circ} 1^{\circ}$, $38^{\circ} 2^{\circ}$, quæ multiplicata primùm per scrupula $13^{\circ} 1^{\circ}$, $3^{\circ} 2^{\circ}$, & inde distributa in scrupula $23^{\circ} 1^{\circ}$, $52^{\circ} 2^{\circ}$, ostendunt interuallum temporis inter veram & adparentem synodum scrupulorum $35^{\circ} 1^{\circ}$, $21^{\circ} 2^{\circ}$, horæ vnus.

Cæterum tùm ex parallaxi longitudinis Δ ad \odot , quæ congruit veræ synodo, tùm ex vero motu Δ horario à \odot facile æstimabit sagax logista, vtrum ad vnã, an duas horas, antequam vel post veram synodon visum Δ motum exquirere conueniat, eò quod hic motus subito ac singulis horis ob multas causas variatur.

Nec obscurum hoc est, quod tempus datum iuxta præceptum 55. momento ipso veræ \odot terminari intelligitur in quadrante orientali, in occidentali autem eodem ipso momento inchoari.

Item cum Canones trianguli orthogonij parallaxeon conditi sint ad horarum initia, commodius est datum hoc siue adsumptum tempus sic accommodare, vt si non ambæ, altera saltem eius extremitas initio alicuius horæ velut articulo congruat, vt calculus sit facilior.

Postremò nullum est interuallum inter veram & adparentem synodon, sed potiùs eadem vera ac visæ copula, quando vera incidit in ipsum nonagesimum gradum, qui quadrantem orientalem dirimit ab occidentali. Ibi enim nulla fit parallaxis in longitudinem, verum tota procumbit in latitudinem.

LVII. PRAECEPTVM. DE IPSO TEMPORE AD-

parentis synodi duorum luminum.

Interuallum temporis iam inuentum, quod inter veram & adparentem

rentem synodon intercedit, aufer tempore veræ synodi in quadrante orientali, vel ante nonagesimum gradum, adde autem in quadrante occidentali, vel post 90 gradum, quemadmodum etiam admonent ipsi Canones. Ratio præcepti in promptu est, quia adparens synodus veram præcedit in orientali, sequitur autem in quadrante occidentali, ut in nostro exemplo. Quia vera synodus fit in quadrante occidentali, intervallum inter veram & adparentem synodum, addendum est tempore veræ synodi. Fit autem hæc vera synodus mense Aprilis diebus 8. plenis horisq; 11. ac scrupulis 55 1^a, 22 2^a. & intervallum in præcedenti præcepto inuentum est scrupulorum 55 1^a, 21 2^a. horæ unus. Erit igitur tempus adparentis synodi post primos 8. dies Aprilis, elapsis à media nocte in nonum diem horis 12. scrupulis 30 1^a, 43 2^a, id est, paulò post meridiem, in Regiomonte inclyta Borussorum ciuitate.

LVIII. PRÆCEPTUM. QVOMODO EXAMINE-

tur tempus adparentis synodi & de parallaxi ☽ à ☉ in latitudinem sub ipsa synodo adparenti.

Examen temporis hæc gubernatur regula. In adparente synodo duorum luminum vera ipsorum loca tantum inter se distant, quanta est Lunæ ad ☉ parallaxis in longitudinem. Ad tempus igitur adparentis synodi, quod hæcenus non absq; labore scrutati sumus, exquiri-
to per 54. Præceptum æquas parallaxes ☽ ad ☉ tum longitudinis, tum simul etiam latitudinis, propter ea quæ sunt reliqua. Inuenias & veram ☽ à ☉ distantiam per 43. præceptum. Inde animum ac cogitationem tuam huc transfer. Si luminum distantia æqualis est parallaxi longitudinis ☽ ad ☉, tempus inuentum omnino congruit adparenti synodo. Si autem maior est distantia luminum, quàm parallaxis ☽ ad ☉ in longitudinem, quanta est ipsarum differentia, tantum visus locus ☽ visam ☉ præcedit quidem in orientali, sequitur autem in occidentali quadrante. Sed si minor est distantia, quanta rursus est ipsarum differentia, tantum visus locus ☽ visam ☉ sequitur quidem in orientali, præcedit autem in occidentali. Ut in nostro exemplo ad tempus adparentis synodi per 54. præceptum offertur parallaxis ☽ ad ☉ longitudinis quidem scr. 17 1^a, 59 2^a, latitudinis verò scr. 34 1^a, 27 2^a, cuius etiam usus paulò post patebit. Et quia intervallum veræ & adparentis synodi est scr. 35 1^a, 21 2^a, unius horæ, vera ☽ à ☉ distantia vel euectio est scrupulorum 17 1^a, 56 2^a, quia motus horarius ☽ à ☉ est scr. 30 1^a, 24 1^a ferè. Vides igitur distantiam ☉ & ☽ ita æquari parallaxi longitudinis ☽ ad ☉ ut tribus tantum secundis scrupulis ab ea superetur. Tempus igitur adparentis synodi rectè nobis inuentum est.

Quod si hæc differentia aliquantò maior existeret, eam diuisam per De emen-
motum datic-

Δογμασtica
Regula gu-
bernatrix bus-
ius examinis.

ne temporis.

motum Δ visum à \odot horarium prius inuentum hoc loco adijunge-
res tempori adparentis synodi, eo quod vera distantia minor est quam
visa, in quadrante occidentali, vbi visus locus constanter à vero rece-
dit in præcedentia. Vt tribus secundis scrup. congruunt hic ferè scrupu-
la 8 2^a, quæ addita constituerent tempus adparentis synodi aliquan-
to subtilius videlicet, dies 8, horas 12. scr. 30 1^a, 51 2^a, mensis Aprilis
omnia plena. Ac quo minus dubitet logista astrophilus, quando hanc
postremam particulam temporis prius inuento addere conueniat, vel
auferre, sit hæc tabella in conspectu.

Quando vera lumi- num distantia, quam parallaxis longitudi- nis Δ ad \odot fuerit.	Maior in qua- drante	Orientali	ADDE.
		Occidentali	AUFFER.
	Minor in qua- drante	Orientali	AUFFER.
		Occidentali	ADDE.

LIX. PRAECEPTVM. DE VERA LATITVDINE

Δ sub ipsam adparentem synodon.

Similis ratio est ei, quæ supra in præcepto 53. tradita est. Inuenias
enim verum Δ motum simpliciter ad interuallum temporis, quo ve-
ra ac visa copula inter se distant. Eum vero motui latitudinis inuento
ad veram syzygiam adde vel aufer, prout interuallum ipsum tempo-
ris vel addendum fuit, vel auferendum. Ita enim comparabis verum
latitudinis Δ motum ad visam copulam, per quem iuxta præceptum
29. venaberis ipsam Δ latitudinem. Vt in nostro exemplo interuallum
veræ ac visæ copulæ fuit scrup. 35 1^a, 21 2^a, vnus [horæ addendum], in
quo spacio verus Δ motus à \odot est scrup. 17 1^a, 56 2^a. Solis autem ferè,
scrup. 1 1^a, 27 2^a, quæ addita inuicem efficiunt motum Δ simpliciter scrup.
19 1^a, 23 2^a. Hic similiter addendus est ad verum motum latitudinis
 Δ sexa. 1. part. 24. scrup. 19 1^a, 28 2^a, congruentem veræ synodo. Con-
gruet igitur visæ copulæ verus latitudinis Δ motus sex. 1. par. 24. scrup.
38 1^a, 51 2^a, per quem ex Canone latitudinis venabimur veram latitu-
dinem Δ boream scrup. 27 1^a, 57 2^a.

LX. PRAECEPTVM. DE LATITVDINE Δ AD-

parente sub ipsam adparentem synodon.

Primum inuenta sit sub ipsam adparentem synodon tum paralla-
xis latitudinis Δ à \odot per 58. præceptum, tum vera latitudo Δ per an-
tecedens. Deinde si fuerint eiusdem adfectionis, adde eas inuicem, si di-
uersæ, minorem aufer à maiori, Collectum enim hoc modo, vel residuum
ostendit latitudinem Δ visam boream vel austrinam, iuxta proprietatem
maioris

maioris numeri. Caterum ultra secundum Clima versus nostra hæc loca Borea, parallaxis latitudinis Δ semper est Austrina. Inuenimus ergo parallaxin latitudinis Δ , Austrinam scr. 34 1^a , 27 2^a , sub ipsam adparentem synodon & veram eius latitudinem Boream scr. 27 1^a , 57 2^a . Relinquitur ergo visa latitudo Δ in ipso momento adparentis synodi scr. 6 1^a , 30 2^a , Australis.

LXI. PRAECEPTVM. VTRVM ADPARENS

synodos duorum luminum sit ecliptica.

Ptolomæus hanc tradit regulam seu normam dijudicandi synodos *An fiat Ecliptica* ab ijs, quæ non sunt eclipticæ. Si ad mediam syzygiam novilunij motus æqualis latitudinis Δ fuerit maior partibus 69. scrup. 20 1^a , & minor partibus 101. scr. 22 1^a , ut circa nodum deuehentem, vel maior partibus 258. scr. 38 1^a , & minor partibus 290. scr. 40 1^a , ut circa nodum euehentem, fieri potest, ut adparens synodos sit ecliptica. Extra hos autem terminos motus latitudinis non fiunt eclipses. \odot . Ac consultum erit logistæ prius vii hoc $\kappa\epsilon\tau\eta\gamma\epsilon\iota\varsigma$, ne calculi parallaxeon labor temerè suscipiatur. Ut ad mediam syzygiam huius nostri novilunij æqualis motus latitudinis est part. 89. scr. 18 1^a , ferè, maior scilicet partibus 69. & minor partibus 101. imò incidit in ipsum penè nodum deuehentem. Pronunciabis ergo hanc syzygià esse eclipticam.

Certiùs autem argumentum hoc est. Quando visa latitudo Δ sub adparentem synodon maior est summa semidiametrorum adparentium \odot & Δ non subibit \odot Eclipsin, Si minor autem fuerit, planè subibit. Ut in nostro exemplo per 49. præceptum inuenta est semidiametros \odot quidem scr. 16 1^a , 9 2^a , Δ verò scr. 16 1^a , 29 2^a , ut sit summa vtriusq; scr. 32 1^a , 38 2^a . At visa latitudo Δ sub adparentem synodon scrupulorū tantum 6 1^a , 30 2^a . Omnino igitur \odot Eclipsin subibit.

LXII. PRAECEPTVM. DE DIGITIS

Eclipticis in defectu \odot .

Similis & hic ratio est ei, quæ supra in 51. præcepto tradita est. A *Quantus fiat defectus.* summa videlicet duarum semidiametrorum \odot & Δ aufer latitudinem Δ visam sub adparentem synodon. Cum hoc reliquo & diametro \odot adparenti ingredi canonem digitorum Eclipticorum, vel semel, vel iterum, si opus fuerit, prorsus ut suprà docuimus. Ut summa semidiametrorum adparentium \odot & Δ est scr. 32 1^a , 38 2^a , unde visa latitudo Δ scr. 6 1^a , 30 2^a , ablata reliqua facit scr. 26 1^a , 8 2^a . Et semidiameter \odot adparens est scr. 16 1^a , 9 2^a , per hæc igitur duo proxima ex Canone venaberis digitos eclipticos 943 1^a .

LXIII. PRAECEPTVM. DE SCRVPVLIS,

& tempore incidentiæ.

Initium huius calculi non est dissimile ei formæ, quam supra tradi-

Duratio sen-
dit

*magnitudo
temporis.*

*Tempora
ἐμπύσεως
καὶ ἀναπύ-
σεως ἐν
defectu
non sunt
equalia.*

dit præceptum 52: Eodem enim modo Canonem scrupulorum inci-
dentia seu casus & moræ dimidiata videlicet priorem ingredi, cum
summa adparentium semidiametrorum ☉ & ☽ & cum visa latitu-
dine ☽ congruenti ad synodon adparentem. Facta enim emendatione
per partem congruentem, si opus fuerit, mox excerpes scrupula inci-
dentia. Itaq; in nostro exemplo venaberis incidentia scrup. 31 1^a,
38 2^a, quæ distributa in certi temporis motum visum ☽ à ☉ osten-
dunt tempus casus, vt quia motus ☽ visus à ☉ inuentus est scrupulo-
rum 23 1^a, 52 2^a, in hora vna, scrupulis 4 1^a, 38 2^a, ideo facta primum
multiplicatione, postea diuisione iuxta doctrinam vel τὸ ἐπιβάλλοντες
vel communis logistica, habebis horam 1, scrupulaq; 26 1^a ferè, tem-
pus videlicet incidentia, vt ab initio defectus ad medium eius, siue ad-
parentem synodon. Huic autem tempori vulgus æquale assumit tem-
pus ἀναπύσεως, repletionis seu recuperationis luminis.

Verum hæc tempora non sunt omnino paria nisi cum visa copula
duorum luminum inciderit in ipsum nonagesimum gradum distin-
guentem duos quadrantes orientalem & occidentalem.

Nam in orientali quadrante tempus ἐμπύσεως minus est tempore
ἀναπύσεως, contra verò in occidentali tempus ἐμπύσεως maius
tempore ἀναπύσεως. Quare si libet summam veritatem huius rei
scrutari, sic agito. Inuenias motum ☽ visum à ☉ vnus horæ tum an-
tecedentis, tum sequentis adparentem synodon iuxta doctrinam præ-
cepti 55. Scrupula incidentia distributa per motum ☽ congruentem
vni quidem horæ ante synodon dabunt tempus incidentia, sed post
synodon tempus ἀναπύσεως vel emersionis.

LXIII. PRAECEPTVM. DE LATITVDINE ☽ VISA

ad initium & finem Eclipsis ☉.

Initio inueniendus est motus visæ latitudinis ☽ sub adparentis sy-
nodi momentum. Huic si abstuleris scrupula incidentia, existeret mo-
tus visæ latitudinis, per quem ex Canone latitudinis ☽ venari licet la-
titudinem ☽ visam ad initium defectus, sed si eadem scrupula adiece-
ris, existeret motus visæ latitudinis, per quem similiter capere licet vi-
sam ☽ latitudinem ad finem eclipsis. Sed vt inuenias motum illum la-
titudinis congruentem visæ latitudini ☽ sub adparentem synodon, in-
trandus est Canon latitudinis ☽ in eclipsis arealiter, vt vocant. Et
considerare hæc duo oportet, vtrum circa deuehentem vel ascenden-
tem nodum fiat defectus, & qualis sit latitudo ☽ visa. Verum exem-
plo rem breuissimè cognosces. In nostra eclipsi visa latitudo est austra-
lis scr. 6 1^a, 30 2^a, & constat ex prioribus fieri eam circa nodum deue-
hentem. In area igitur Canonis dum quæro latitudinis visæ scrupula

6¹^a, 30²^a, deprehendo per partem proportionalem deberi eam 18 gradui 15. scr. præter 3. dodecatemor. eò quòd eclipsis fiat circa nodum deuehentem. Iam si à 3. dodecatemorijs, parte 1, scr. 15 1^a, dem- pferis incidentiæ scrupula 31 1^a, 38 2^a, existet motus visæ latitudinis dodecatemorum 3. part. 0. scr. 43 1^a, 22 2^a, ad initium videlicet eclis- pſis. Sed si eadem addideris, erit motus visæ latitudinis ad finem eclis- pſis dodecatemor. 3. part. 1. scr. 49 1^a, 38 2^a. Per hos motus visæ lati- tud. excerpſes iuxta doctrinam præcepti 9. visam. Δ latitud. ad initium quidem eclipsis huius scrup. 3 1^a, 46 2^a ad finem verò scr. 9 1^a, 14 2^a. utrobique australem.

Postremo ex his præceptis quæ tradita sunt hæctenus de utraq; pa- rallaxi, manifestum est. quod sicut parallaxis in longitudinem osten- dit intervallum inter veram & visam copulam, ita cognitio parall. in latitud. patefacit, utrum fiat eclipsis \odot . & quanta sit eius tum magni- tudo, tum duratio, deniq; in quam partem spectet pars eius obscurata.

LXV. PRÆCEPTVM DE TYPIS SEV DIA-

grammatis eclipsium describendis.

In signo A duæ linæ BD & CE secant se $\pi\sigma\sigma\delta\delta\delta$, & intelligatur B signum versus occasum, D versus ortum, C versus aquilonem, E signum deniq; versus austrum, & A signum vel centrum corporis \odot in defectu illius, vel in lunari deliquio centrum vmbrosi circuli, qui ad Δ transitum spectat. Recta etiam BD iter solare, vel eclipticam desi- gnabit. Hic habeas præterea pro concepta diagrammatis magnitudine lineam rectam distributam in partes æquales 60. vel 70. Iam ad de- scribendum typum eclipsis \odot , oportet hæc data esse, semidiametros adparentes, ut in nostro exemplo \odot quidem 16 1^a, 9 2^a, & Δ 16 1^a, 29 2^a, & latitudinem Δ visam ad initium 3 1^a, 46 2^a ac finem 9 1^a, 14 2^a, eclipsis, po-

nea diuisa transfer in lineam CE. vt ei sit æqualis AF. Similiterq; visæ latitudini ad finem $1^a, 14^2^a$, fiat æqualis recta AG.

Fit enim eclipsis initium versus occasum, & finis versus ortum. Signa autem F & G. traducantur per lineas ipsi BD. rectæ parallelas, vt F H, & G K conuenienter in circuli circumferentiam, vt H, fiat initium eclipsis, vbi D secundum visum contingit corpus Solare. K verò signum finis eiusdem eclipsis, & iungatur recta HK. adparens videlicet iter D in signo L, diuisa per æqualia. Dehinc in linea diuisa numeris scrupula semidiametri $\odot 16^1^a, 9^2^a$, & rursus extremarum notarum intervallo, centroq; A describitur circulus OPMQ. Similiter etiam intervallo semidiametri Lunaris, centrisq; HLK. tres Lunares circuli describantur, eritq; in H initium defectus in L medium, in K finis, & partem \odot obscuratam representabit $\text{X}\mu\alpha$ MNOP. quale Græci vocant $\alpha\mu\phi\iota\kappa\upsilon\epsilon\tau\omicron\varsigma$, reliqua pars corporis \odot , MNOQ $\mu\omega\omega\epsilon\delta\eta\varsigma$ adhuc conspicua manet, nec occultatur Lunæ interuentu.

*Pictura seu
descriptio
eclipsis D*

In eclipsi autem Lunari sint rursus hæc data. Semidiameter D adparens, vt in exemplo superiori scrupulorum $16^1^a, 23^2^a$, & semidiameter vmbre scr. $44^1^a, 37^2^a$, latitudoq; D vera ad initium quidem scr. $7^1^a, 7^2^a$, borealis, ad finem verò scr. $4^1^a, 22^2^a$, Australis. Intervallo igitur summæ vtriusq; semidiametri scrupulorum scilicet $61^1^a, 0^2^a$, centroq; A, rursus descriptus sit circulus BCDE, & eodem centro, intervallo autem semidiametri vmbre scr. $44^1^a, 37^2^a$, alius circulus angustior FG, in cuius

peripheria Lunare corpus ad initium, & finem eclipsis contingit vmbre terrenæ pyramidem. Notetur autem latitudo borea scilicet $7^1^a, 7^2^a$, congruens initio eclipsis in signo H, quod adminiculo parallelæ traducatur versus notam occasus in K. Similiterq; sit L versus ortum & Austrum nota finis eclipsis. Iunctaq; recta KL, eaq; per medium di-

uisa in signo M circuli Lunares intervallo scr. $16^1^a, 23^2^a$, describantur tres, centris KML. Itaq; in K initium eclipsis, in M medium, in L finis representatur hoc diagrammate, similiter vt in antecedenti.

Hactenus igitur eclisium \odot & D tractatio penitus absoluta est. Ac reuertor nunc ad ζ , stellas errantes, quarum reliquam doctrinam breuiter

breviter percurram, ut alio loco explicatam prolixius.

LXVI. PRAECEPTVM. DE SYNODO ERRATICARUM Stellarum cum inerrantibus.

Intelligimus hinc stellas inerrantes eas potissimum, quæ vel in Zodiaco, vel in proximis circa eum locis collocantur. Ac quod ad ☉ attinet, cum quotannis iisdem diebus cum inerrantibus copuletur, expedita ratio est. Nam si quis horam congressus ☉ cum aliqua harum fixarum scire cupit, postquam dies exploratus est, & intervallum stellæ ac Solis, distribue hoc in motum ☉ horarium, qui constat ex superioribus. Ita enim venaberis intervallum temporis addendum vel auferendum priori, prout ☉ vel antecesserit, vel secutus fuerit inerrantem. Exemplo nihil opus est.

Luna verò, quia spacio 27. dierum peruagatur totam Zodiaci longitudinem, ac interea cum omnibus inerrantibus congregitur, Ideo congressus eius cum inerrantibus similiter inuestigandus erit, ubi diem cognoveris congressus ☾ cum stella qui dies diu etiam latere haud potest, eum diurnus ☾ motus penè sit partium 13.

Reliquorum quinque planetarum ratio, & propter tarditatem & varietatem motus ipsorum non ita expedita est, sed molestiæ ac laboris multò plus habet. Aliquot enim calculi experimentis explorandus erit vicinque dies congressus alicuius horum cum data stella inerrante. Inde per diurnum planetæ motum cætera, ut prius, absoluet solers logista, ita tamen, ut sedulo meminerit, eum diurnum motum non diu sibi constare, sed mutari ipsam quoque, tardius quidem circa apogeon, & perigeon epicycli, velocius autem circa medios eiusdem transitus, seu longitudes, ut vocant. Imò planetas hos quinque alias esse ὡς ἀπὸ λανθάνοντες, alias προκρινόμενοι, id est, alias directos, alias retrogrados, quibus appellationibus vulgò vtuntur.

Potest autem hoc præceptum ad alium usum transferri. Vbi enim ex canonibus doctrinæ primi mobilis vel ex nostris tabulis ortuum & occasuum explorata fuerit, ea Zodiaci pars, cum qua stella aliqua fixa ascendit, vel descendit in dato Horizonte, poterit studiosus Astrologicarum prædictionum ad consimilem modum inuestigare diem, quo datus planeta cum ea inerrante ascendat, vel descendat.

LXVII. PRAECEPTVM. DE SYNODO MUTUA binorum Planetarum.

Multò adhuc plus negocij est in huius rei inuestigatione. De syzygijs ☉ & ☾ supra copiose dictum est, quæ doctrinæ pars ad huius quoque rei tractationem vtiliter accommodari potest. Luna quidem ut 27. diebus ferè percurrit totum signiferum, ita intra dies 30. vel non

multo plures cum reliquis s. planetis congregitur. Lunæ igitur ratio satis adhuc expedita est iuxta doctrinam præcepti præcedentis, itemq; ☉, cuius adparens motus ab æqualitate non ita multum recedit, etiā in altera stella, cum qua congressum ☉ scire libet, obseruare oportet, retrò ne an porrò feratur.

Reliqui
quinq; inter
se.

Reliquorum autem s. planetarum binorum mutuos inter se congressus explorare difficilis labor est, ac molestus. Suprà quidem in præcepto 38. tradidit rationem, qua inueniatur tempus mediæ synodi quorumcunq; binorum planetarum, sed vt diem veri congressus scrutari queas, opus est crebri calculi experimentis veras vtriusq; distantias explorare. Consultum autem erit ei, qui huius generis synodos inuestigare velit. prius condere canones diarij motus harum s. erraticarum, iuxta doctrinam præcepti nostri. 36.

LXVIII. PRÆCEPTVM. VTRVM PLANETA

progrediatur, vel regrediatur, vel sit stationalis ad datum tempus.

Varias habent motus sui adfectiones quinq; erraticæ stellæ ♄ ♀ ♂ ♃ & ♄. quia alias porrò, alias retrò cientur, alias quasi consistere & cursum inhibere videntur, ex qua varietate Greci alias atq; alias adpellationes eis tribuerunt ὀπολεπτικός vocarent, & προσηγνικούς & σκεῖζορτας sicut vulgo directos, retrogrados & stationales. Verùm de adpellationibus sæpe dictum est.

Iam vt cognoscas, qualis sit adfectio motus planetæ ad datum tempus, inuenias coræquatam anomaliam vtranq; Eccentri & Epicycli vel commutationis, & ingressus canonem stationum, cum anomalia Eccentri excerpe conuenienter numeros primæ & secundæ stationis.

Quod si numerus anomalix commutationis fuerit æqualis numero stationis primæ, stella erit stationalis in primo semicirculo epicycli, in quo ab apogeo eius descendit ad perigeon, & inde fiet retrogradus, seu, vt Græci vocant, προσηγνικός, sin æqualis fuerit numero stationis secundæ, planeta erit similiter stationalis in altero semicirculo Epicycli, in quo iterum euehitur in summum eius fastigium, ita vt incipiat iterum progredi, cum aliquandiu antè migrasset in priora. Quod si anomalia commutationis, vtriusq; stationis numero inæqualis extiterit, planeta aut erit ὀπολεπτικός aut προσηγνικός: ὀπολεπτικός quidem, cum numerus anomalix huius vel minor fuerit numero primæ stationis, vel maior numero stationis secundæ: προσηγνικός autem cum idem numerus, vel maior fuerit numero stationis primæ, vel minor numero stationis secundæ.

Iuxta has igitur regulas pronuntiabis de affectione planetæ.

Ceterum

directus ὀπολεπτικός
retrogradus προσηγνικός
stationarius σκεῖζορτας

Vischus Reho:
gradus stationalis

Vide fol 127

σκεῖζορτας
πρωτος

σκεῖζορτας
δευτερος

Ceterum hæc ex elementis huius doctrinæ nota sunt, planeta motum mediocrem esse circa medios epicycli transitus, velocissimum vero, in consequentia quidem circa apogeon epicycli, in præcedentia autem circa eiusdem perigeon. Hæc per se facilia sunt, nec admodum desiderant exemplum, veruntamen adijcio vnum. Ut ad natalitium tempus illustri s. ducis Borussiae coequata anomalia eccentrici H est part. 25. scr. 26 1^a. Commutationis verò part. 131. scr. 18 1^a ferè. Ingressus igitur canonem stationum sub caractere H cum anomalia eccentrici, ex ærpe stationem, primam quidem partium 112. scr. 46 1^a ferè, secundam verò partium 247. scr. 14 1^a. Ad anomalia commutationis neutri numero æqualis est, sed maior numero primæ, minor autem numero secundæ. Vnde pronuntiabis H eo tempore fuisse $\pi\sigma\omicron\gamma\eta\lambda\iota\kappa\omicron\varsigma$ vel retrogradum. At simili ratione inuenies reliquas quatuor erraticas fuisse tunc directas, vel rectum habuisse cursum in consequentia.

LXIX. PRÆCEPTVM. DE TEM-

pore stationis.

Per antecedens præceptum sit explorata primùm adfectio stellæ. Deinde vtiusq; stationis arcus per datam commutationis anomaliæ æquatam. Ac vt breuiter complectar summam rei exemplis vtendum est. Ad datum igitur tempus inclyti Ducis Borussiae Saturnus $\pi\sigma\omicron\gamma\eta\lambda\iota\kappa\omicron\varsigma$ habebat coequatam epicycli anomaliæ part. 131. scr. 18 1^a, & arcus stationis primæ erat part. 112. scr. 46. secundæ part. 247. 14 1^a, velim iam scire, ante quot dies ceperit esse retrograda eius stella. Subtraho igitur arcum primæ stationis ab anomalia commutationis coequata, & reliquum arcum part. 18. scr. 32. distribue in motum diurnum æqualem commutationis H scr. 57 1^a, 72 2^a, 44 3^a. Ita enim deprehendes dies 19. cum dimidio ferè. Ante totidem dies Saturni stella $\sigma\alpha\gamma\iota\tau\omicron\upsilon$ seu stationalis subiit hanc adfectionem. Similiter si partes anomaliæ 131. scr. 18 1^a, abieceris ex numero secundæ stationis part. 247. 14 1^a, reliquæ erunt partes 155. scr. 56 1^a, quæ distributa in eundem æqualem diarium, offerunt dies ferè 122. Post dies igitur ferè 122. absoluto regressu erit H iterum stationalis, & inde directus seu $\nu\omega\lambda\epsilon\pi\iota\kappa\omicron\varsigma$, quod à Regiomontani nostri Ephemeridibus parum dissentit. Ceterum cognito tam initio quam fine regressus H notum erit simul totum tempus regressus H dierum videlicet 142. ferè. Ad eundem modum addisces & totum tempus $\nu\omega\lambda\epsilon\pi\iota\kappa\omicron\varsigma$, seu progressus stellæ per superiorem epicycli partem.

LXX. PRÆCEPTVM. DE EXAMINE

calculi antecedentis,

Motus me-

diocris.

Velocissimus

porro, retro.

coæquatam eccentrici & epicycli, & per eccentrici anomaliam præterea arcum stationis. tum primæ, tum secundæ, cum quorum altero conuenienti si congruit coæquata epicycli anomalia, recte se habet prior calculus, sin minus, vtendum est eodem cursu antecedentis doctrinæ, tantisper, donec satis respondeat. Quam calculi iserationem seu correctionem ☿ stella propter perpetuam instabilitatem maxime omnium flagitat. Repetatur proximum exemplum. Numeratis diebus 122. à die natalicio inclyti Borussiæ ducis quære anomaliam vtrinq; coæquatam eccentrici & Epicycli, & per eccentrici rursus arcum secundæ stationis, qui si æqualis est coæquata anomaliam recte se habet calculus. Quod si coæquata anomalia epicycli minor fuerit arcu secundæ stationis, differentiam utriusq; distributam in motum diurnum æqualem commutationis, adde tempori prius inuento, dierum 122. sed si maior fuerit, aufer. Et hanc formam emendationis iterato tantisper, donec omnia rite consentiant. Verum quia alio loco de stationibus plura dixi, non ero nunc prolixior.

LXXI. PRÆCEPTVM. CALCVLVS LATI-

tudinis trium superiorum ☿ 4 ☿.

*De canoni-
bus latitudi-
num.*

In commentarijs nostris Astronomicis plura de latitudinibus ☿. Planetarum disseruimus. Ideo hinc ero breuiter & calculi tantum formam breuiter monstrabo, sicut autem tres superiores planeta duplici latitudine euagantur ab orbita Solis. ita & duplicem canonem habent singuli priorem scrupulorum proportionalium, posteriorem ipsius latitudinis. Ex priori per coæquatam eccentrici anomaliam capiuntur scrupula proportionalia, ex posteriore autem latitudo ipsa per coæquatam anomaliam commutationis. Verum dissimilitudo obseruanda est. In ☿ per anomaliam commutationis sumitur latitudo, Austrina quidem, dum coæquata eccentrici anomalia maior est partib. 40. & minor partibus 220. Borea autem per reliquum anomaliam Eccentrici semicirculum. Sed in 4 similiter per commutationis anomaliam capitur latitudo Australis quidem, dum eccentrici anomalia maior est partibus 110. & minor partibus 290. Borea verò per reliquum anomaliam eccentrici semicirculum quemadmodum hoc discrimen tituli quoq; docent. At in ☿ quæ pars Canonis præbet scrupula proportionalia, ex eadem petes latitudinem planetæ, quæ Boreà ne sit, an Australis, titulus ipse indicabit.

Postquam igitur vtrinq; conuenienter excerpteris, scrupula inquam proportionalia & latitudinem, ipsa pars congruens scrupulis erit latitudo quæsitæ. Verum exemplo res intelligitur commodius. Ad natalicium tempus inclyti Borussiæ ducis anomalia ☿ coæquata est partium 23. scr. 26. 1^a, id est, dodecatemorij 0. part. 25. scr. 26. 1^a, per quam
excerpo

excerpo scrupula proportionalia $14\ 1^a$, $58\ 2^a$. Commutationis verò anomalia est parti. $13\ 1$, scr. $28\ 1^a$, id est, dodecatemiorum 4. part. 11 , scr. $18\ 1^a$, per quam sumi oportet latitudinem Boream, iuxta prius dicta, & iuxta indicium Canonis, eaq; monstratur in Canone partium 2, scr. $50\ 1^a$. Iam pars congruens scrupulis $14\ 1^a$, $58\ 2^a$, de partibus 2, scr. $50\ 1^a$, est scr. $41\ 1^a$, $36\ 2^a$, Borea scilicet H . latitudo.

LXXII. PRAECEPTVM. CALCV-

lus latitudinum ♀ & ♂.

Venus & ♂ quemadmodum à rectissimo ac perpetuo Solis itinere *De canoni-* exorbitant triplici latitudine, declinationis scilicet, reflexionis, ac de- *bus.* uiationis: ita singulae latitudines singulis explicantur canonibus, ac rursum singuli canones sua habent scrupula proportionalia. Deuiatio quidem ♀ semper Borea est, ♂ autem Austrina.

Præcepti summa hæc est. Per anomaliam eccentrici excerpe scrupula. *PRÆCEPTVM.* Per anomaliam verò commutationis latitudinem, hac cautione, ut quæ *IVM.* pars canonis præbet scrupula, ex eadem quoq; petas latitudinem declinationis & reflexionis, tituli verò indicant qualis sit latitudo. Deinde de singulis latitudinibus sumito partes congruentes suis latitudinibus. Postremò si omnes fuerint vnus adfectionis, aggregata ex illis partibus congruentibus summa, erit quæsitæ latitudo. Sin minus, duæ saltem eiusdem adfectionis aggregentur, ut vel tertia latitudo ex ea summa reijciatur, vel summa ambarum ex tertia. Sic enim relinquetur quæsitæ latitudo, retinens eius nomen, cuius erat excessus siue residuum. Exemplo res sit dilucidior. Coæquata eccentrici anomalia Ven- *Exemplū ♀.* neris est dodecatemo. 11 . part. 18 . scrupulor. $57\ 1^a$. Commutationis autem dodecat. 11 . par. 19 . scr. $13\ 1^a$. Per coæquatam igitur eccentrici anomaliam ostenduntur scrupula declinationis $11\ 1^a$, $11\ 2^a$, & per commutationis anomaliam latitudo ipsa declinationis par. 1 . scr. $1\ 1^a$ australis. Pars igitur congruens scrupulis proportionalibus est scr. $11\ 1^a$, $22\ 2^a$, latitudo declinationis australis. Similiter eccentrici quidem anomalia ex canone reflexionis suppeditat scrupula $59\ 1^a$. Commutationis verò anomalia latitudinem reflexionis australem par. 0 . scr. $15\ 1^a$. Pars igitur congruens scrupulorum $14\ 1^a$, $45\ 2^a$, reflexio australis rursum. Postremò per eccentrici anomaliam habentur scrupula $57\ 1^a$, $11\ 2^a$, deuiatio aut scr. $7\ 1^a$, quæ semper in ♀ est Borealis. Pars quoq; hic congruens est scrupulorum $6\ 1^a$, $40\ 2^a$, iam priores duæ latitudines australes aggregatæ faciunt scr. $26\ 1^a$, $7\ 2^a$, à quibus reiecta latitudo deuiationis scrup. $6\ 1^a$, $40\ 2^a$, Borealis, relinquit ♀ latitudinem adhuc Australem scr. $19\ 1^a$, $27\ 2^a$, quæsitam.

Eodem modo & ♂ latitudines expediuntur, nisi quod in ♂ deci-

R.

ma.

ma pars obliquationis seu reflexionis rejicitur quidem dum eccentrici anomalia fuerit minor quadrante, vel maior dodrante circuli, additur autem per alterum semicirculum anomalie eccentrici, ut fiat con-
quata obliquatio.

LXXIII. PRAECEPTVM. DE OCCULTA-
tionibus & emerfionibus horum quinq; planetarum.

Η 4 ♂.

ἑώοι καὶ πρὸ
καρδμυοι.

ἑωέριοι καὶ
ἐπόμενοι.
ἀκρόνυκτοι.

ἑπιτολῆ.

καὶ ἡ δ' ἄφα
πσιμὸς.

♀ & ☿.

1. ἀνατολῆ
ἑωδρία.

2. καὶ ἡ δ' ἄφα
ἑωδρία.

3. ἑώα ἀνα-
τολῆ.

Tres superiores planetæ interdum supra horizontem ascendunt ex eo tempore quod inter synodum & verum ipsorum diametrum cum ☉ positum intercedit. Id fit in primo semicirculo Epicycli vel commutationis ab apogeo ad perigeon, & vocantur ipsi planetæ ἑώοι καὶ πρὸ καρδμυοι, ut à Sole relictī in præcedentia. Sed per reliquum semicirculum Epicycli vel commutationis, id est, à diametro ipsorum positum cum ☉ rursus ad syzygiam synodicam, vel à perigeo epicycli ad apogeon nocte ascendunt seu oriuntur, & vocantur ἑωέριοι καὶ ἐπόμενοι tanquam à ☉ collocati in partes Zodiaci consequentes, vel posteriores. Ac hi tres quidem planetæ ἀκρόνυκτοι siue ἀκρόνυχτοι adpellantur in diametro Solis positu, vel oppositione ut vocant. eò quòd noctis initio oriuntur vel euehantur supra Horizontem.

Itaq; pater eos emergere ex radijs Solaribus, seu ut Græci vocant ἐπιτέλλεσθαι paulò post synodon cum ☉, quando ab apogeo epicycli aliquantulum recesserunt in consequentia, siue versus ortum, siue in primum semicirculum: econtrà verò occultari & abire eosdem è conspectu nostro, ac velut evanescere, seu ut Græci loquuntur, καὶ ὑπείθεσθαι, καὶ ἀφανίζεσθαι in altero semicirculo epicycli, non procul vel ab eius ab apogeo in præcedentia, vel paulò antè, quàm cum eis Sol rursus congregiatur.

At Veneris & Mercurij stella pluribus adhuc modis circa Solem inuoluuntur. Nam ubi aliquantulum processerunt à congressu & apogei epicycli in consequentia, vesperi emergunt ex radijs solaribus, præbentq; se conspiciendas. Itaq; in semicirculo epicycli orientali, per quem ab apogeo eius descendunt ad perigeon vocantur ἑωέριοι καὶ ἐπόμενοι contrà quàm superiores planetæ. In hoc autem primo semicirculo non multò ante perigeon epicycli rursus occultantur ingressi radios ☉, quæ est καὶ ἡ δ' ἄφα ἑωδρία. Porro in altero semicirculo epicycli spectante ad occasum non ita procul à perigeo stella emergens rursus ex radijs Solis adparet denuò per totum hunc semicirculum manè ante ortum Solis, & vocatur ἑώος καὶ πρὸ καρδμυοι & ἡ δ' ἄφα. Prima autem eius adparitio, & ut Græci vocant πρῶτη φάσις, Ptolemæo

est ἕως ἀνατολῆς. Donec planeta ascendens per hunc alterum semicirculum parum absit rursus ab apogeo, tanquam ad ☉ reuertens. Hic igitur denuò ingerens se ipsius radijs abit è conspectu nostro, quæ Ptolemaeo est ἕως δύσεως ἢ κρύψεως. Sed complector breui tabella summam eorum, quæ commemorauī.

B 4 & ☿ contingit paulò	{	post apogeon	{ ἕως ἀνατολῆς	{	In perigeo au- tem epicycli sunt è regione ☉ ἀκρόνυκτοι.
		Epicy.	{		
Veneri & ☿ contingit	{	ante idem a- pogeon Epic.	{ ἕως δύσεως	{	In apogeo au- tem & peri- geo Soli con- iunguntur.
		1. post apo. Epicy.	{ ἕως ἀνατολῆς		
		2. ante peri- geon Epi.	{ ἕως δύσεως		
		3. post perig.	{ ἕως ἀνατολῆς		
		4. ante apog. Epicy.	{ ἕως κρύψεως		

Qualem verò positum planeta in Epicyclo habeat, ex coæquata commutationis anomalia iudicari potest, quæ semper ab apogeo eiusdem numeratur in consequentia siue versus ortum.

Iam ut cognoscas, vtrum conspiciatur planeta vel non conspiciatur, emergat, vel abdat se in radios solares, Ad datum tempus habeas & coæquatam Epicycli anomaliā, & veram eius distantiam à ☉. & ex anomalia quidem speciem ortus vel occasus iudicabis iuxta tabel-
lam antecedentem. Ingressus autem canonem occultationis. & emer-
sionis, postremum omnium, cum signo, in quo est planeta, excerpe ar-
cum congruentem ei speciei ortus & occasus, qui arcus si minor fuerit
quàm distantia planetæ à ☉ conspicietur planeta, sin maior delitescet
intra radios solares. Sed si æqualis fuerit, planeta emerget, vel occul-
tabitur, prout distantia eius à ☉ crescet ad sequentes dies, vel decre-
scet. Cæterum quia canon subijcit planetas tenere initia dodecatemo-
riorum, ideo cum planeta non versatur in initio alicuius dodecatemorij,
utendum erit parte congruente ad 30. gradus.

Addo & hic tandem exemplum. Ad natalicium tempus Illustrissi-
mi Borussiae ducis coæquata Veneris anomalia est partium 349. scr. 13.
1^a. Quare cum non multum absit ab apogeo Epicycli, vel conspici-
tur ☿, vel subijt iam radios Solis occasu matutino ἕως κρύψεως ἢ δύσεως.
Est autem Venus in principio ♀ distans à loco ☉ partibus tantum 5.

scrup. 5 1^a. Et ex Canone ad initium II sub titulo occasus matutinus colligitur arcus part. 7. scrup. 38 1^a, qui maior est quàm distantia ☿ à ☉. Ideo Venus disparuit iam oppressa radijs solaribus.

Caterùm quia hæc variantur in singulis Climatis, vberiores Canones breui dabimus, nisi alij hoc nos labore subleuárint.

Æquatio huius Canonis posterioris semper subtrahitur

Contra vero semper adjicitur, quoties æqua'e

ralium ex recentiorum sententia
tani doctrinam.

Handwritten text in a cursive script, likely a historical document or letter. The text is written in a dark ink on aged, slightly discolored paper. The script is dense and fills most of the page, with some lines appearing to be part of a list or a series of short paragraphs. The handwriting is characteristic of the 16th or 17th century.

Handwritten text at the bottom of the page, possibly a signature or a closing remark. It is written in a similar cursive script to the main body of the text.

SIG NORVM STELLARVMQVE

SEPTENTRIONALIS PLAGAE

Canonica descriptio.

Numerauimus autem omnium inerrantium stellarum longi-
tudines ab ea stella, quæ prima est in Aste-
rismo ARIETIS.

| CYNO-FORMAE STELLARVM | | Longi | | Lat | | Ma |

Germania.

Georgius Germanicus cap. 7. sui Calendarij sic scribit. Pro con-
clusionis huius Capituli Apostolum legistis monitum idem quod in
Epochis & et & meridiis à Christo Domino in annis Julianis tabularum
Prutemicarum ab anno 100 inclusivè usque ad 400 exclusivè item ab
anno 900 inclusivè usque ad 1100 exclusivè. ita ab anno 1700 in-
clusivè usque ad annum 1800 exclusivè desubscribitur motus unius mē-
sis lunaris quindici. Eiusdem laborant etiam tabulae Maginij in
radiis & et & meridiis & et D. à Christo Domino in annis Juli-
anis exceptis annis 100 et 200. in quibus revoletur predictus Maginij cor-
ruptio. Nam motus motus ad tempus aliquod infra dictos annos con-
tinuos inclusus in 41 scriptis ex Tab. Prutemicis praemissis
collectis differunt à motibus iuxta 8. rariorum tabul. perperam quibus
diffa huius unius integritas Sydygus predictus exstantis. Huius

Monetary

Continetur deinde ab his partibus per minuta horarum et graduum, partibus
 et his exprimere ac nominare, ut infra et gradus et alia horarum, Labiat
 A his numeris. Reliqua partes hoc ordine succedant.
